1. Summary / Scope

1.1. Summary

This report contains a summary of the Kaibab 2018 LiDAR acquisition task order, issued by the USGS under their Contract G16PC00016 on 6 September 2018. The Albers portion of the task order yielded a QL1 project area covering 2223 square miles over Northern and Southeastern Arizona and a QL2 project area covering 2430 square miles over Northern Arizona. The intent of this document is only to provide specific validation information for the data acquisition/collection, processing, and production of deliverables completed as specified in the task order.

1.2. Scope

Aerial topographic LiDAR was acquired using state of the art technology along with the necessary surveyed ground control points (GCPs) and airborne GPS and inertial navigation systems. The aerial data collection was designed with the following specifications listed in Table 1 below.

Table 1. Originally Planned LiDAR Specifications

QL	Average Point Density	Flight Altitude (AGL)	Field of View	Minimum Side Overlap	RMSEz
QL1	8 pts / m ²	1800 m	30°	60%	≤ 10 cm
QL2	2 pts / m ²	2100 m	36°	30%	≤ 10 cm

1.3. Coverage

The project boundary covers 4653 square miles and encompasses portions of Northern and Southeastern Arizona. A buffer of 100 meters was created to meet task order specifications. Project extents are shown in Figure 1.

1.4. Duration

LiDAR data was acquired from 10 August 2018 to 7 September 2018 in 50 total lifts. See “Section: 2.5. Time Period” for more details.

1.5. Issues

There were no major issues to report for this project.

1.6. Deliverables

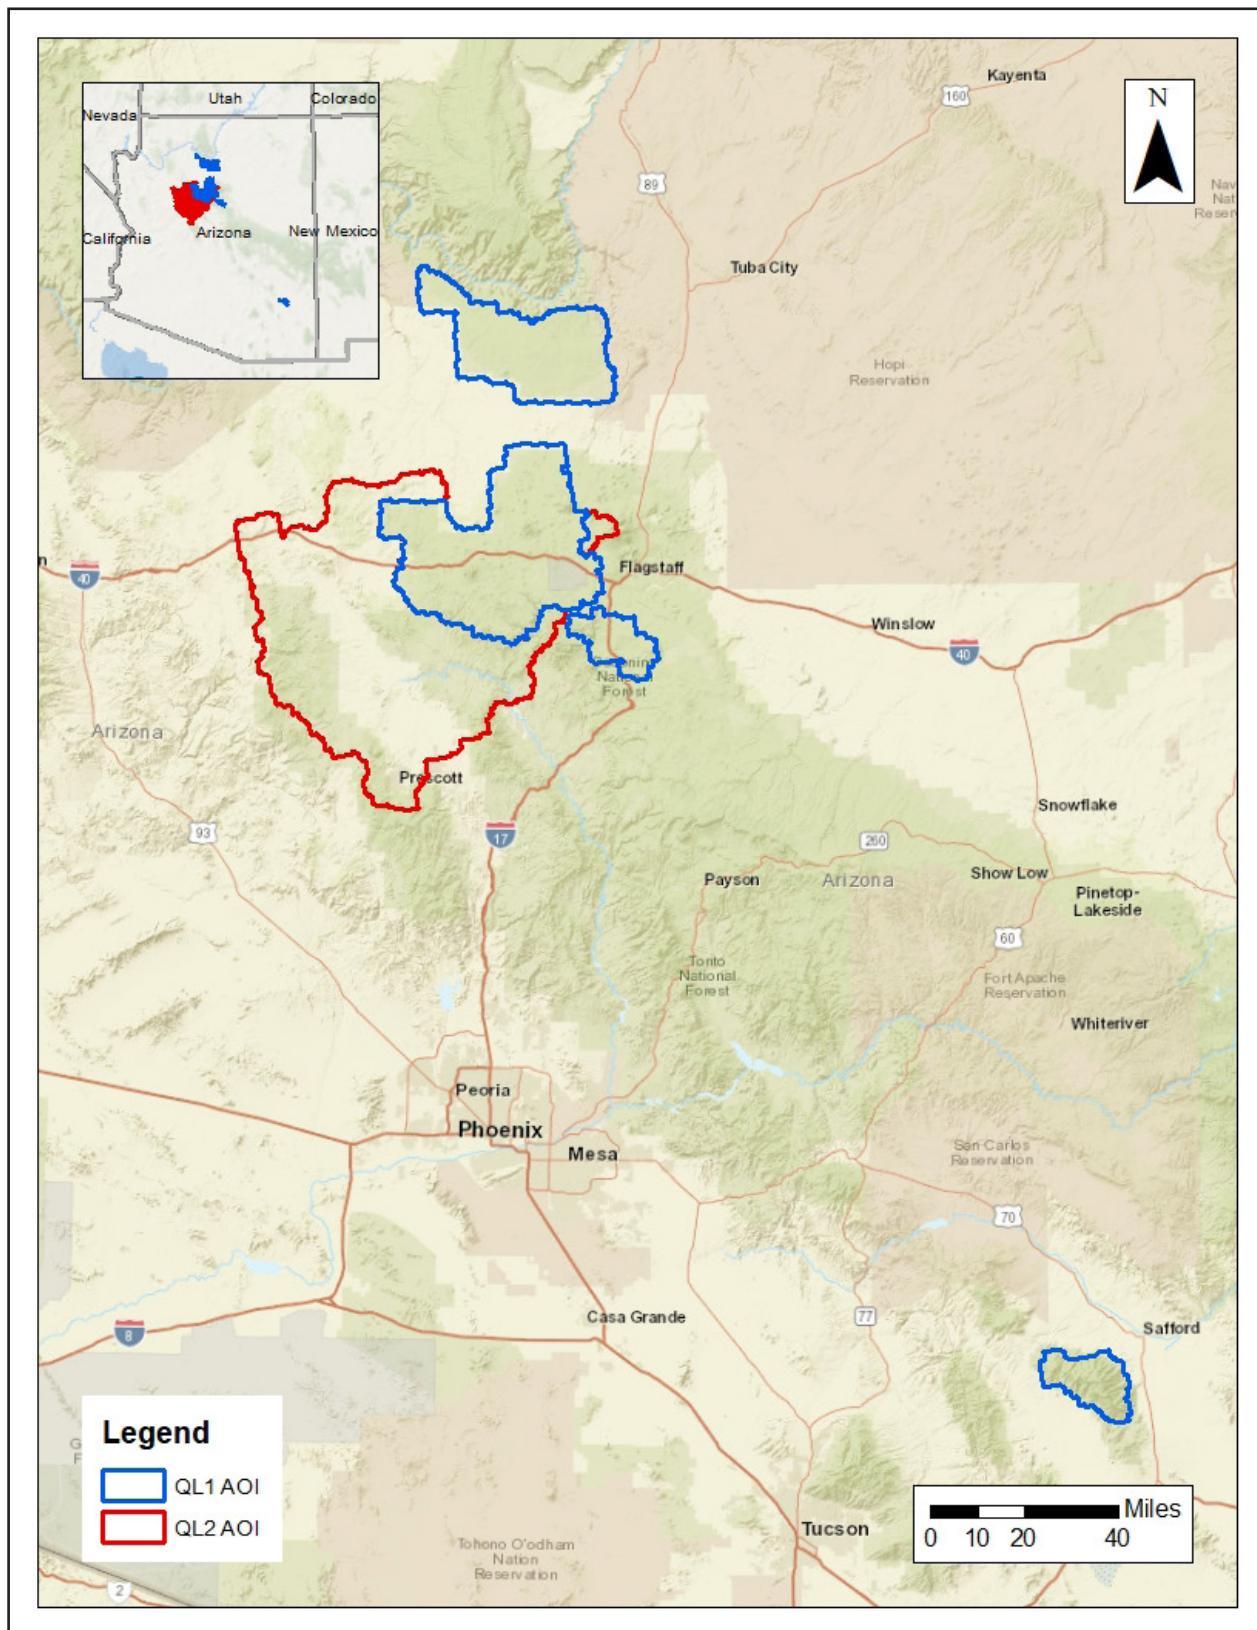

QL1:

- Classified LiDAR point cloud data tiles in .LAS 1.4 format
- Continuous hydroflattened breaklines in Esri file geodatabase format
- 0.5-meter non-hydroflattened bare earth DEM tiles in GeoTIFF format
- 0.5-meter intensity imagery tiles in GeoTIFF format

QL2:

- Classified LiDAR point cloud data tiles in .LAS 1.4 format
- Continuous hydro-flattened breaklines in Esri file geodatabase format
- 1-meter hydro-flattened bare earth digital elevation model (DEM) tiles in GeoTIFF format
- 1-meter intensity imagery tiles in GeoTIFF format

All geospatial deliverables were produced with a horizontal datum/projection of NAD83 (2011), Albers Equal Area, Meters and a vertical datum/projection of NAVD88, Geoid 12b, Meters. All tiled deliverables have a tile size of 1000 m x 1000 m.

2. Planning / Equipment

2.1. Flight Planning

Flight planning was based on the unique project requirements and characteristics of the project site. The basis of planning included: required accuracies, type of development, amount / type of vegetation within project area, required data posting, and potential altitude restrictions for flights in project vicinity.

Detailed project flight planning calculations were performed for the project using Leica MissionPro and RiPARAMETER planning software. The entire target area was comprised of 790 planned flight lines (Figure 2 and Figure 3).

2.2. LiDAR Sensor

Quantum Spatial utilized Leica ALS80 and Riegl VQ 1560i LiDAR sensors (Figure 4), serial number(s) 3061, 8170, and 8194 during the project.

The Leica ALS 80 system is capable of collecting data at a maximum frequency of 1,000 kHz. The system utilizes a Multi-Pulse in the Air option (MPIA). The sensor also has the capacity for unlimited range returns from each outbound pulse. The intensity of the returns is also captured during aerial acquisition.

The Riegl 1560i system has a laser pulse repetition rate of up to 2 MHz resulting in more than 1.3 million measurements per second. The system utilizes a Multi-Pulse in the Air option (MPIA). The sensor is also equipped with the ability to measure up to an unlimited number of targets per pulse from the laser.

A brief summary of the aerial acquisition parameters for the project are shown in the LiDAR System Specifications in Table 2.

2.3. Aircraft

All flights for the project were accomplished through the use of customized planes. Plane type and tail numbers are listed below.

LiDAR Collection Planes

- Cessna 402 (twin-piston), Tail Numbers: N6255Q, N41GD
- Cessna Caravan (single-turboprop) (C208), Tail Number(s): N704MD

These aircraft provided an ideal, stable aerial base for LiDAR and orthoimagery acquisition. These aerial platforms have relatively fast cruise speeds which are beneficial for project mobilization / demobilization while maintaining relatively slow stall speeds which proved ideal for collection of high-density, consistent data posting using state-of-the-art Riegl and Leica LiDAR systems. Some of Quantum Spatial's operating aircraft can be seen in Figure 5 below.

3. Processing Summary

3.1. Flight Logs

Flight logs were completed by LIDAR sensor technicians for each mission during acquisition. These logs depict a variety of information, including:

- Job / Project #
- Flight Date / Lift Number
- FOV (Field of View)
- Scan Rate (HZ)
- Pulse Rate Frequency (Hz)
- Ground Speed
- Altitude
- Base Station
- PDOP avoidance times
- Flight Line #
- Flight Line Start and Stop Times
- Flight Line Altitude (AMSL)
- Heading
- Speed
- Returns
- Crab

Notes: (Visibility, winds, ride, weather, temperature, dew point, pressure, etc).

3.2. LiDAR Processing

Inertial Explorer/Applanix + POSPac Mobile Mapping Suite software was used for post-processing of airborne GPS and inertial data (IMU), which is critical to the positioning and orientation of the LiDAR sensor during all flights. Inertial Explorer/POSPac combines aircraft raw trajectory data with stationary GPS base station data yielding a “Smoothed Best Estimate Trajectory (SBET) necessary for additional post processing software to develop the resulting geo-referenced point cloud from the LiDAR missions.

During the sensor trajectory processing (combining GPS & IMU datasets) certain statistical graphs and tables are generated within the Inertial Explorer/Applanix POSPac processing environment which are commonly used as indicators of processing stability and accuracy. This data for analysis include: Max horizontal / vertical GPS variance, separation plot, altitude plot, PDOP plot, base station baseline length, processing mode, number of satellite vehicles, and mission trajectory.

The generated point cloud is the mathematical three dimensional composite of all returns from all laser pulses as determined from the aerial mission. Laser point data are imported into TerraScan and a manual calibration is performed to assess the system offsets for pitch, roll, heading and scale. At this point this data is ready for analysis, classification, and filtering to generate a bare earth surface model in which the above-ground features are removed from the data set. Point clouds were created using the Leica CloudPro software and the Applanix + POSPac Post Processor software. GeoCue distributive processing software was used in the creation of some files needed in downstream processing, as well as in the tiling of the dataset into more manageable file sizes. TerraScan and TerraModeler software packages were then used for the automated data classification, manual cleanup, and bare earth generation. Project specific macros were developed to classify the ground and remove side overlap between parallel flight lines.

All data was manually reviewed and any remaining artifacts removed using functionality provided by TerraScan and TerraModeler. Global Mapper was used as a final check of the bare earth dataset. GeoCue was used to create the deliverable industry-standard LAS files for both the All Point Cloud Data and the Bare Earth. In-house software was then used to perform final statistical analysis of the classes in the LAS files.

3.3. LAS Classification Scheme

The classification classes are determined by the USGS Version 1.3 specifications and are an industry standard for the classification of LIDAR point clouds. All data starts the process as Class 1 (Unclassified), and then through automated classification routines, the classifications are determined using TerraScan macro processing.

The classes used in the dataset are as follows and have the following descriptions:

- Class 1 – Processed, but Unclassified – These points would be the catch all for points that do not fit any of the other deliverable classes. This would cover features such as vegetation, cars, etc.
- Class 2 – Bare-Earth Ground – This is the bare earth surface
- Class 7 – Low Noise – Low points, manually identified below the surface that could be noise points in point cloud.
- Class 9 – In-land Water – Points found inside of inland lake/ponds
- Class 17 – Bridge Decks – Points falling on bridge decks.
- Class 18 – High Noise – High points, manually identified above the surface that could be noise points in point cloud.
- Class 20 – Ignored Ground – Points found to be close to breakline features. Points are moved to this class from the Class 2 dataset. This class is ignored during the DEM creation process in order to provide smooth transition between the ground surface and hydro flattened surface.

3.4. Classified LAS Processing

The bare earth surface is then manually reviewed to ensure correct classification on the Class 2 (Ground) points. After the bare- earth surface is finalized; it is then used to generate all hydro-breaklines through heads-up digitization.

All ground (ASPRS Class 2) LiDAR data inside of the Lake Pond and Double Line Drain hydro flattening breaklines were then classified to water (ASPRS Class 9) using TerraScan macro functionality. A buffer of 3 feet was also used around each hydro flattened feature to classify these ground (ASPRS Class 2) points to Ignored ground (ASPRS Class 20). All Lake Pond Island and Double Line Drain Island features were checked to ensure that the ground (ASPRS Class 2) points were reclassified to the correct classification after the automated classification was completed.

All overlap data was processed through automated functionality provided by TerraScan to classify the overlapping flight line data to approved classes by USGS. The overlap data was identified using the Overlap Flag, per LAS 1.4 specifications.

All data was manually reviewed and any remaining artifacts removed using functionality provided by TerraScan and TerraModeler. Global Mapper is used as a final check of the bare earth dataset. GeoCue was then used to create the deliverable industry-standard LAS files for all point cloud data. Quantum Spatial's proprietary software was used to perform final statistical analysis of the classes in the LAS files, on a per tile level to verify final classification metrics and full LAS header

information.

3.5. Hydro-Flattened Breakline Processing

Class 2 LiDAR was used to create a bare earth surface model. The surface model was then used to heads-up digitize 2D breaklines of Inland Streams and Rivers with a 100 foot nominal width and Inland Ponds and Lakes of 2 acres or greater surface area.

Elevation values were assigned to all Inland Ponds and Lakes, Inland Pond and Lake Islands, Inland Streams and Rivers and Inland Stream and River Islands using TerraModeler functionality.

Elevation values were assigned to all Inland streams and rivers using Quantum Spatial's proprietary software.

All ground (ASPRS Class 2) LiDAR data inside of the collected inland breaklines were then classified to water (ASPRS Class 9) using TerraScan macro functionality. A buffer of 3 feet was also used around each hydro flattened feature. These points were moved from ground (ASPRS Class 2) to Ignored Ground (ASPRS Class 20).

The breakline files were then translated to Esri file geodatabase format using Esri conversion tools.

Breaklines are reviewed against lidar intensity imagery to verify completeness of capture. All breaklines are then compared to TINs (triangular irregular networks) created from ground only points prior to water classification. The horizontal placement of breaklines is compared to terrain features and the breakline elevations are compared to lidar elevations to ensure all breaklines match the lidar within acceptable tolerances. Some deviation is expected between breakline and lidar elevations due to monotonicity, connectivity, and flattening rules that are enforced on the breaklines. Once completeness, horizontal placement, and vertical variance is reviewed, all breaklines are reviewed for topological consistency and data integrity using a combination of Esri Data Reviewer tools and proprietary tools.

3.6. Hydro-Flattened Raster DEM Processing

Class 2 LiDAR in conjunction with the hydro breaklines were used to create a 0.5-meter (QL1) non-hydro-flattened DEM and a 1-meter (QL2) hydro-flattened Raster DEM. Using automated scripting routines within ArcMap, a GeoTIFF file was created for each tile. Each surface is reviewed using Global Mapper to check for any surface anomalies or incorrect elevations found within the surface.

3.7. Intensity Image Processing

GeoCue software was used to create the deliverable intensity images. All overlap classes were ignored during this process. This helps to ensure a more aesthetically pleasing image. The GeoCue software was then used to verify full project coverage as well. GeoTIFF files with a cell size of 0.5 meter (QL1) and 1 meter (QL2) were then provided as the deliverable for this dataset requirement.

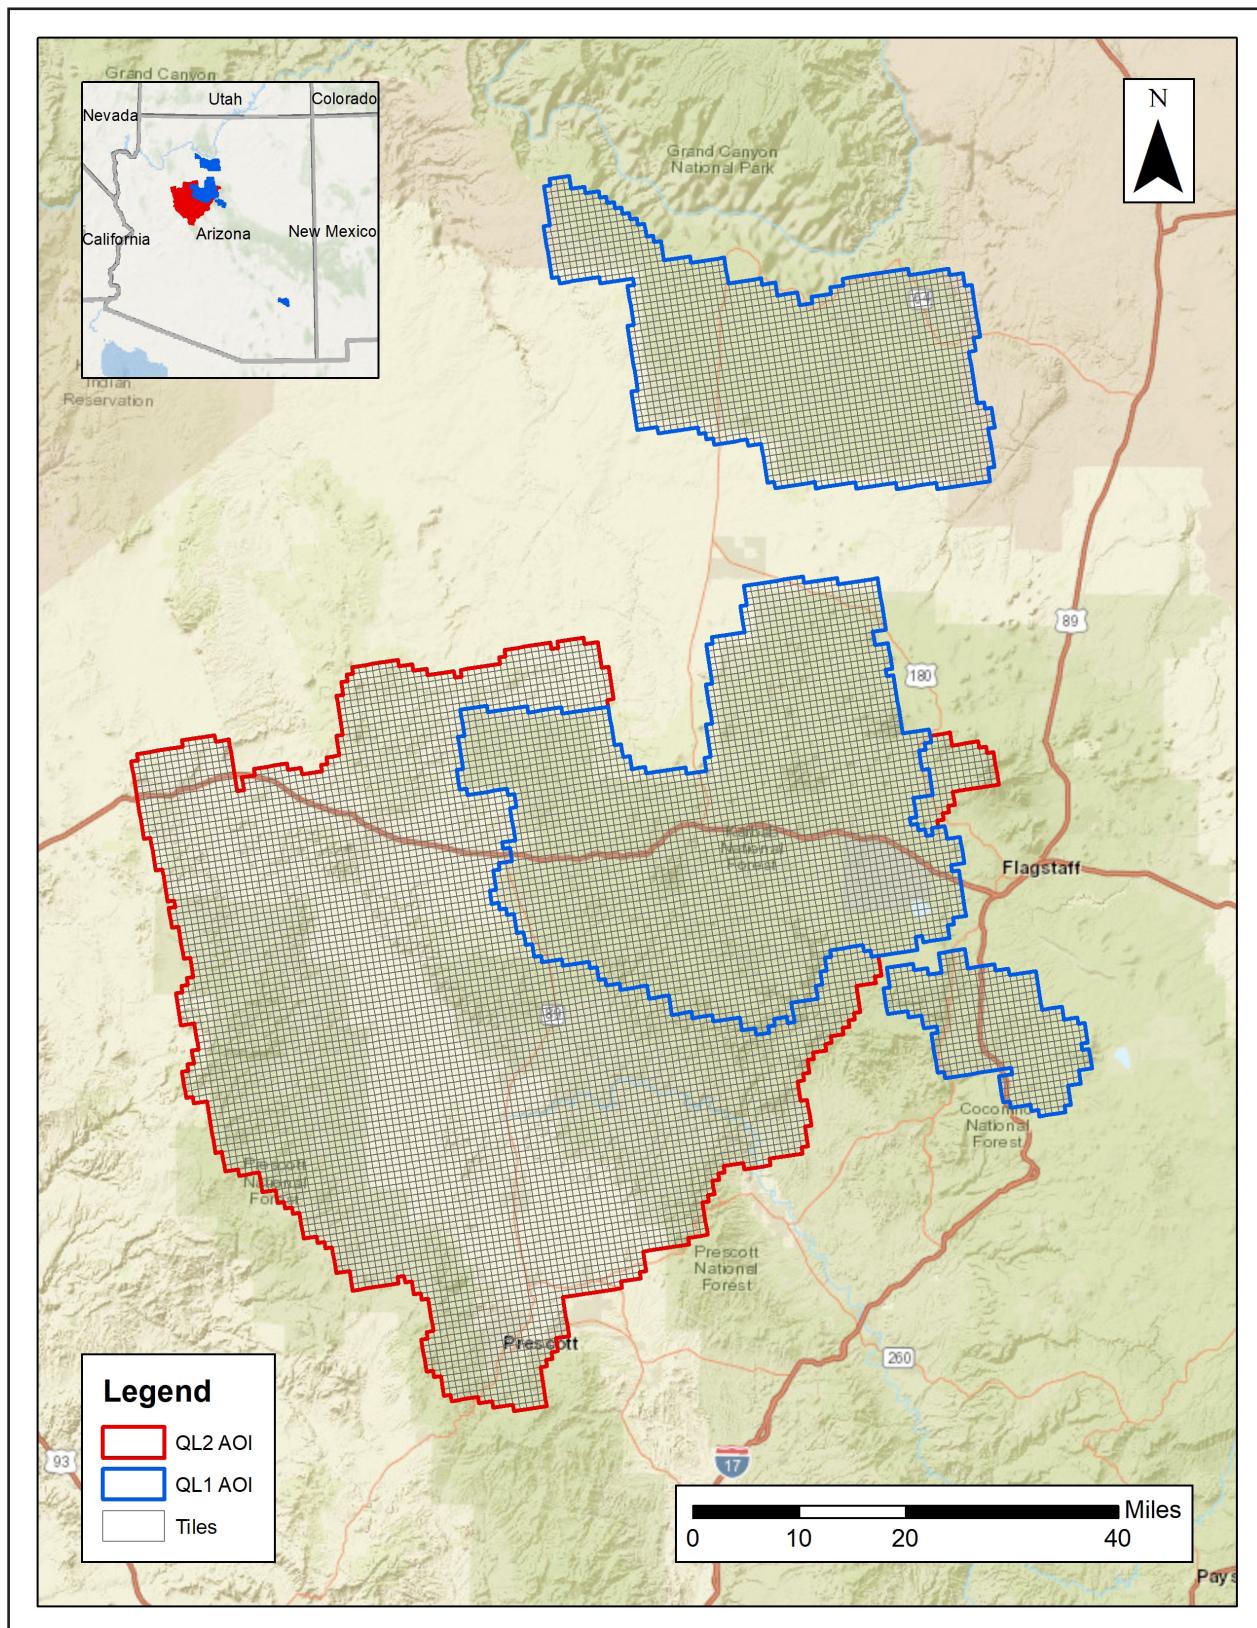

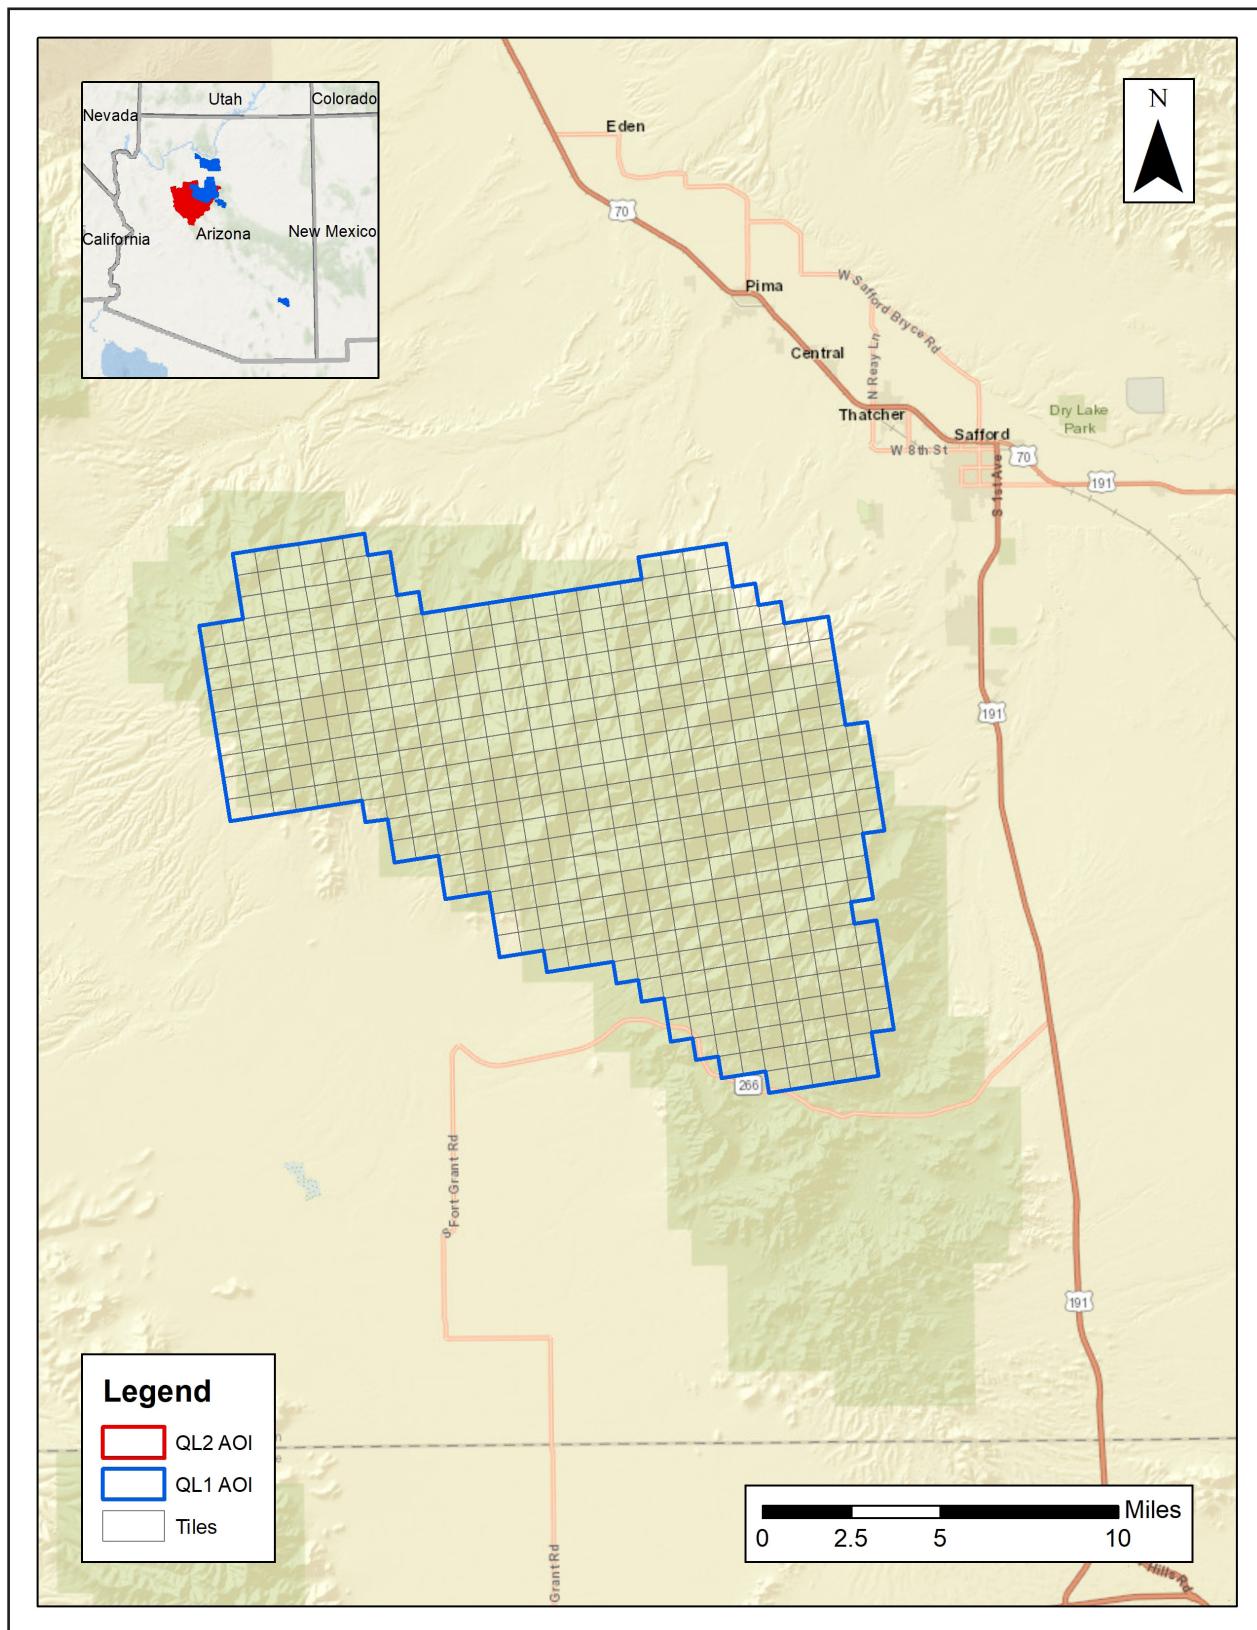

Figure 7. LiDAR Tile Layout - South

4. Project Coverage Verification

Coverage verification was performed by comparing coverage of processed .LAS files captured during project collection to generate project shape files depicting boundaries of specified project areas. Please refer to Figure 8 and Figure 9.

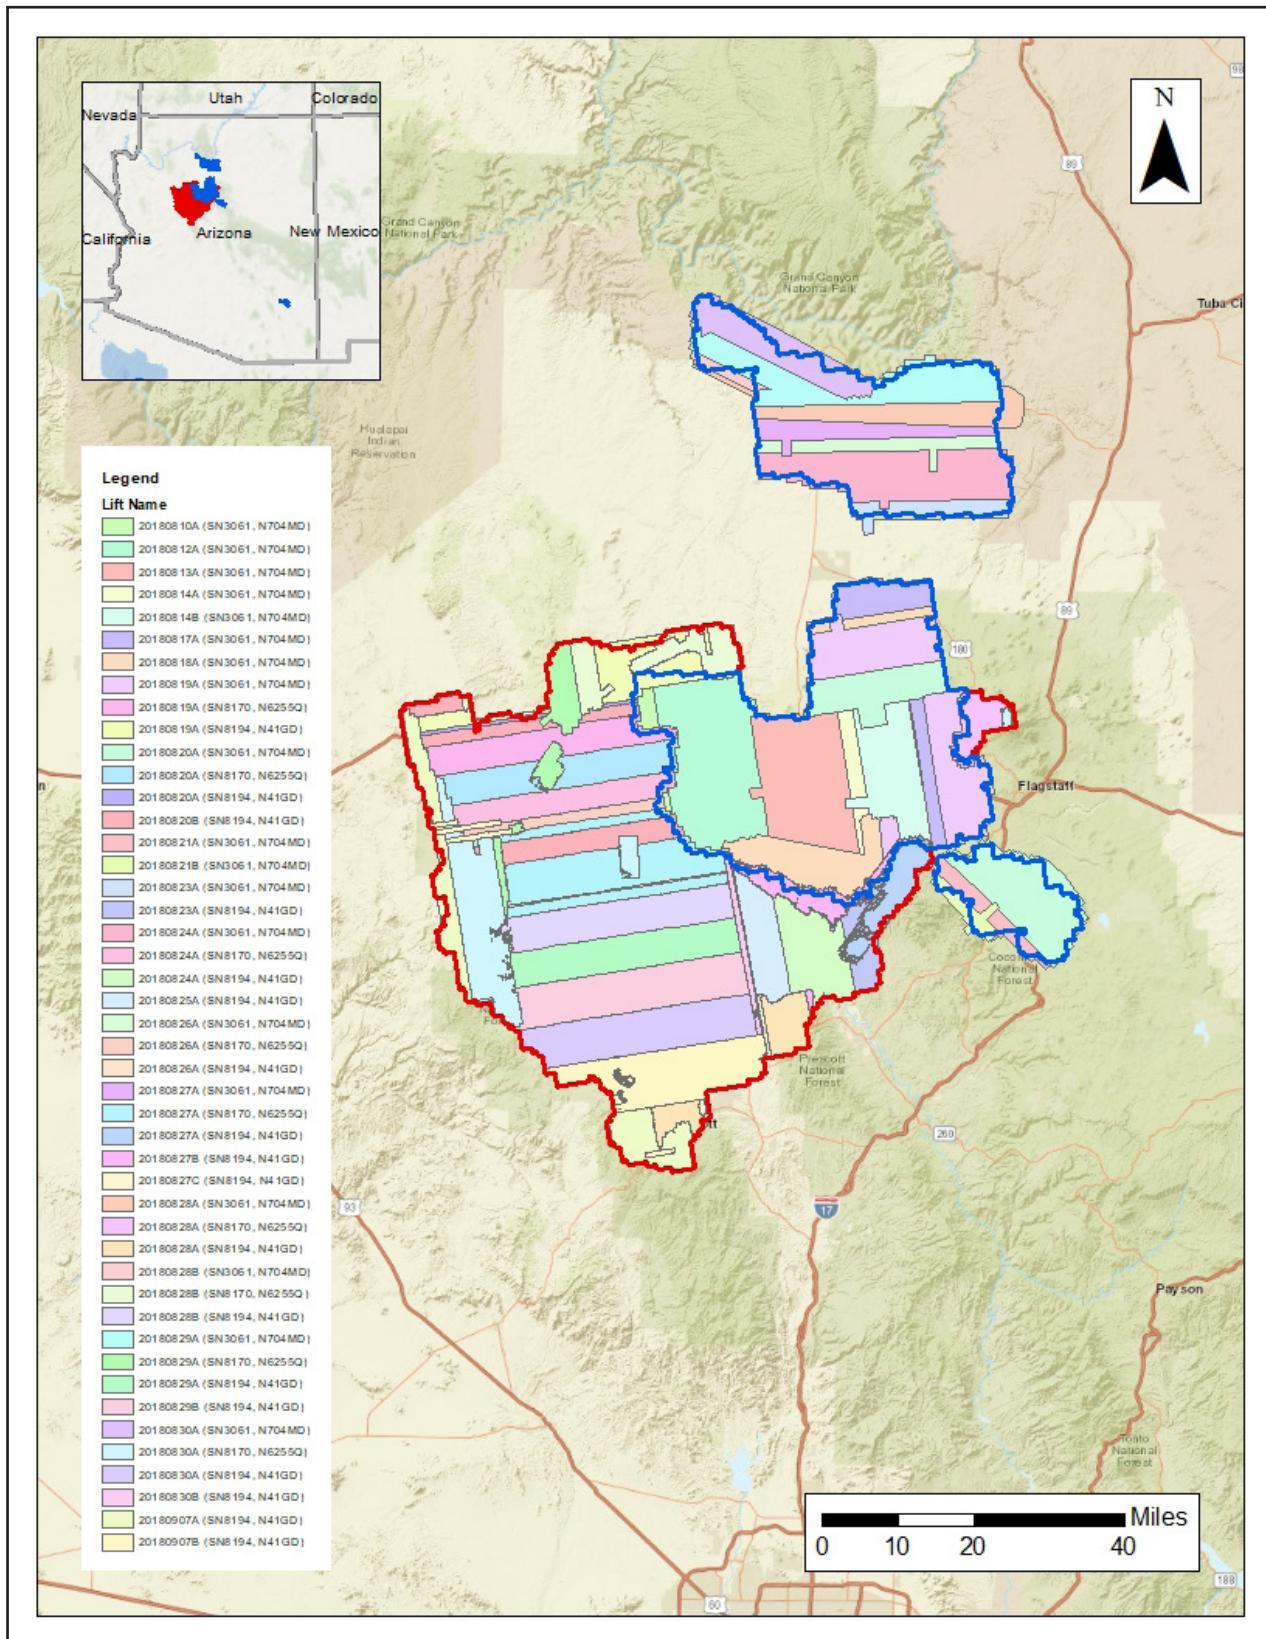

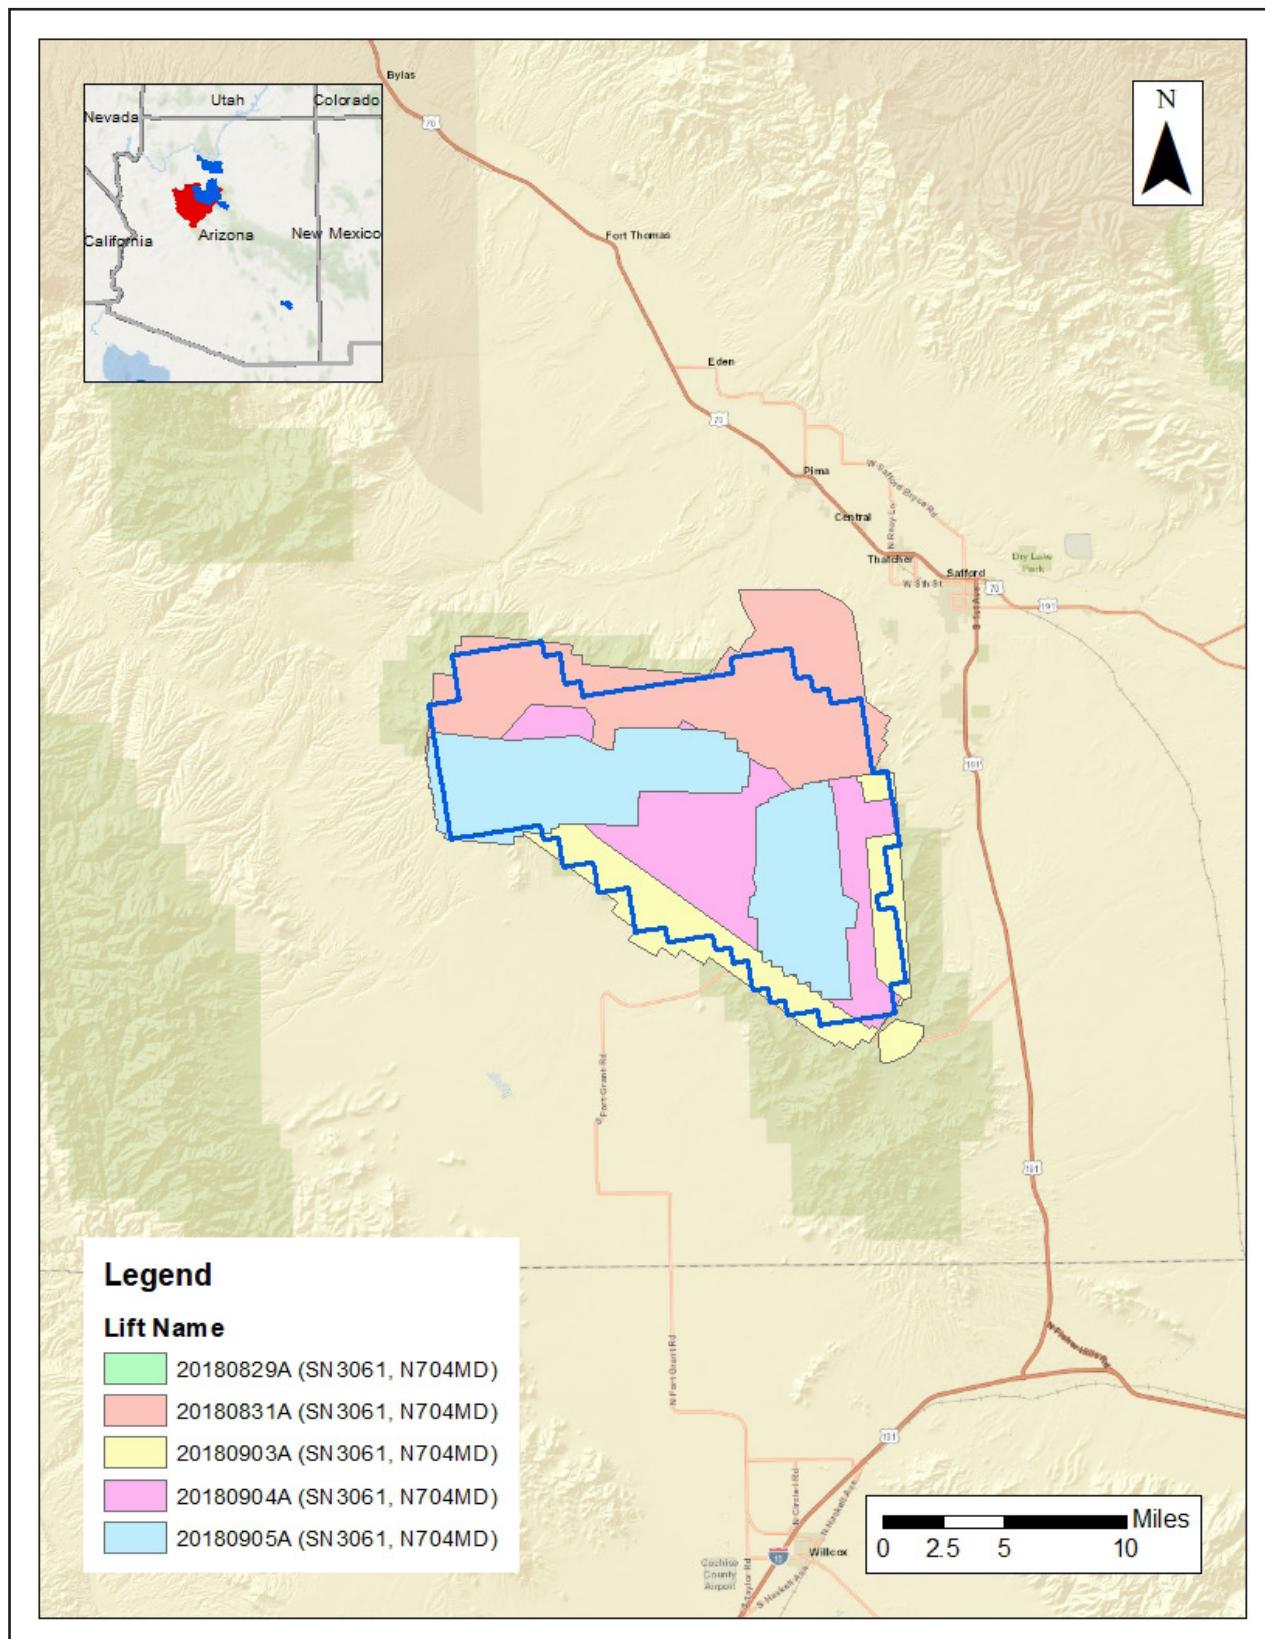

Figure 8. LiDAR Flightline Coverage - North

Figure 9. LiDAR Flightline Coverage - South

5. Ground Control and Check Point Collection

A field survey was completed of 111 ground control (calibration) points along with 190 blind QA points in Non-Vegetated and Vegetated land cover classifications (total of 301 points) as an independent test of the accuracy of this project.

A combination of precise GPS surveying methods, including static and RTK observations were used to establish the 3D position of ground calibration points and QA points for the point classes above. GPS was not an appropriate methodology for surveying in the forested areas during the leaf-on conditions for the actual field survey (which was accomplished after the LiDAR acquisition). Therefore the 3D positions for the forested points were acquired using a GPS-derived offset point located out in the open near the forested area, and using precise offset surveying techniques to derive the 3D position of the forested point from the open control point. The explicit goal for these surveys was to develop 3D positions that were three times greater than the accuracy requirement for the elevation surface. In this case of the blind QA points the goal was a positional accuracy of 5 cm in terms of the RMSE.

The required accuracy testing was performed on the LiDAR dataset (both the LiDAR point cloud and derived DEM's) according to the USGS LiDAR Base Specification Version 1.3 (2018).

5.1. Calibration Control Point Testing

Figure 10 shows the location of each bare earth calibration point for the project area. TerraScan was used to perform a quality assurance check using the LiDAR bare earth calibration points. The results of the surface calibration are not an independent assessment of the accuracy of these project deliverables, but the statistical results do provide additional feedback as to the overall quality of the elevation surface.

5.2. Point Cloud Testing

The project specifications require that only Non-Vegetated Vertical Accuracy (NVA) be computed for raw lidar point cloud swath files. The required accuracy (ACCz) is: 19.6 cm at a 95% confidence level, derived according to NSSDA, i.e., based on RMSE of 10 cm in the "bare earth" and "urban" land cover classes. The NVA was tested with 110 checkpoints located in bare earth and urban (non-vegetated) areas. These check points were not used in the calibration or post processing of the lidar point cloud data. The checkpoints were distributed throughout the project area and were surveyed using GPS techniques. See survey report for additional survey methodologies.

Elevations from the unclassified lidar surface were measured for the x,y location of each check point. Elevations interpolated from the lidar surface were then compared to the elevation values of the surveyed control points. AccuracyZ has been tested to meet 19.6 cm or better Non-Vegetated Vertical Accuracy at 95% confidence level using $RMSE(z) \times 1.9600$ as defined by the National Standards for Spatial Data Accuracy (NSSDA); assessed and reported using National Digital Elevation Program (NDEP)/ASRPS Guidelines. See Figure 11.

5.3. Digital Elevation Model (DEM) Testing

The project specifications require the accuracy (ACCz) of the derived DEM be calculated and reported in two ways:

1. The required NVA is: 19.6 cm at a 95% confidence level, derived according to NSSDA, i.e., based on RMSE of 10 cm in the “bare earth” and “urban” land cover classes. This is a required accuracy. The NVA was tested with 110 checkpoints located in bare earth and urban (non-vegetated) areas. See Figure 11.
2. Vegetated Vertical Accuracy (VVA): VVA shall be reported for “brushlands/low trees” and “tall weeds/crops” land cover classes. The target VVA is: 29.4 cm at the 95th percentile, derived according to ASPRS Guidelines, Vertical Accuracy Reporting for Lidar Data, i.e., based on the 95th percentile error in all vegetated land cover classes combined. This is a target accuracy. The VVA was tested with 80 checkpoints located in tall weeds/ crops and brushlands/low trees (vegetated) areas. The checkpoints were distributed throughout the project area and were surveyed using GPS techniques. See Figure 12.

AccuracyZ has been tested to meet 19.6 cm or better Non-Vegetated Vertical Accuracy at 95% confidence level using $\text{RMSE}(z) \times 1.9600$ as defined by the National Standards for Spatial Data Accuracy (NSSDA); assessed and reported using National Digital Elevation Program (NDEP)/ ASPRS Guidelines.

A brief summary of results are listed below. For more information, See the FOCUS on Accuracy report.

Point Class	Target	Measured	Point Count
Calibration	N/A	0.076	111
Raw NVA	0.196 m	0.084	110
NVA	0.196 m	0.085	110
VVA	0.294 m	0.140	80

Section 1: Survey Report

Introduction

This report contains a comprehensive outline of the Ground Control Survey that supported the LiDAR acquisition of the AOI's. All surveys were performed in such a way as to achieve ground control accuracies that meet or exceed the National Mapping Accuracy Standards.

Project Area

The project area consists of approximately 4200 square miles encompassing Pinaleno Mountains, Kaibab National Forest, and the Coconino National Forest.

Purpose

The purpose of this survey was to establish three-dimensional coordinates for 111 LiDAR calibration points, 109 NVA LiDAR check points, and 82 VVA check points. The points were collected per the flight layout and were uniformly dispersed over the project area.

Date of Survey

Ground control field operations took place between August 21st and September 11th, 2018.

Monumentation

Prior to aerial imagery acquisition, Woolpert field crews performed a field reconnaissance to verify the existence and suitability of pre-selected existing National Geodetic Survey (NGS) control stations. These existing NSRS control stations were utilized as checks to ensure that quality x, y, and z coordinate values were computed for each of the newly established photogrammetric control stations. Recovery information sheets for the existing NGS control stations can be found in Section 4 of this report. A control diagram showing the ground control stations used to support this mapping project can be found in Section 5 of this report.

Accuracy Standards

The relative vertical accuracy of the LiDAR data will be 10 cm RMSEz with swath overlap (between adjacent swaths) and an absolute vertical accuracy of 15cm RMSE.

GPS Equipment

Woolpert utilized 2 Trimble Navigation R10 Model GNSS dual-frequency GPS receivers, 4 Trimble Navigation R8 Model 3 GNSS dual frequency GPS receivers and 4 TSC3 data collectors for this project.

Methodology

Static GPS

The field crew utilized Static GPS surveying throughout the ground control data collection process. Using Static GPS techniques, observations were performed on a total of 10 ground control points. The survey was conducted using a 1-second epoch rate, in a fixed solution, with each observation lasting at least 20 minutes. Each station was occupied twice to insure the necessary horizontal and vertical accuracies were being met for this project.

Real-Time Kinematic (RTK) GPS

The field crew utilized Real-Time Kinematic (RTK) GPS surveying throughout the ground control data collection process. The survey was conducted using a 1-second epoch rate, in a fixed solution RTK mode, with each observation lasting between 60 to 180 seconds. Each station was occupied twice to insure the necessary horizontal and vertical accuracies were being met for this LiDAR / photogrammetric project.

GPS Data Analysis and Processing

The field crew chief processed all session baselines each day using Trimble Navigation's Trimble Business Center (TBC) Version 4.00 baseline processor with the accompanying broadcast ephemeris. Daily processing ensured the integrity of the network as it was constructed, and allowed the field crews to immediately reschedule observations of poor baselines.

Datum Reference and Final Coordinates

The spatial reference system for the AOI is UTM 12N. The datum is NAD83(2011) 2010.00 epoch horizontal. Orthometric heights were derived using Geoid 12B. Units for both the horizontal and vertical datums will be expressed in meters to three (3) decimal places.

Quality Assurance

Existing NGS published bench marks were surveyed to assure that there were no discrepancies in the field observation data. Close examinations of the residuals showed no distortions in orientation or scale. The ground control data meets positional accuracies necessary to support 2 points per 1.0 meters squared (0.7m GSD) data at 95% confidence level as outlined in the Geospatial Positioning Accuracy Standards, Part 3: National Standard for Spatial Data Accuracy (NSSDA), published by the Federal Geographic Data Committee (FGDC-STD-007.3-1998).

Section 3: Ground/Geodetic Control Logs and Photos

This section contains the station recovery information sheets and photographs regarding the ground control positions established for the project. The stations appear as they are ordered in the final coordinate listing of Section 2.

The data is assembled on the following pages

Section 4: Geodetic Control Information and Resources

This section contains NGS Datasheets and the solutions returned from Online Positioning User Service(OPUS) for the control stations that was used to establish 3-dimensional coordinates for the newly established calibration and check points for the project.

The NGS Data Sheet

See file [dsdata.pdf](#) for more information about the datasheet.

CY0710
CY0710.NAD 83(2011) refers to NAD 83 coordinates where the reference frame has

CY0710.in June 1991.

CY0710

CY0710.Significant digits in the geoid height do not necessarily reflect accuracy.

CY0710.GEOID12B height accuracy estimate available [here](#).

CY0710

CY0710.[Photographs](#) are available for this station.

CY0710

CY0710.The X, Y, and Z were computed from the position and the ellipsoidal ht.

CY0710

CY0710.The Laplace correction was computed from DEFLEC12B derived deflections.

CY0710

CY0710.The ellipsoidal height was determined by GPS observations

CY0710.and is referenced to NAD 83.

CY0710

CY0710.The dynamic height is computed by dividing the NAVD 88

CY0710.geopotential number by the normal gravity value computed on the

CY0710.Geodetic Reference System of 1980 (GRS 80) ellipsoid at 45

CY0710.degrees latitude ($g = 980.6199$ gals.).

CY0710

CY0710.The modeled gravity was interpolated from observed gravity values.

CY0710

CY0710. The following values were computed from the NAD 83(2011) position.

STATION DESCRIPTION

CY0710

CY0710'DESCRIBED BY COAST AND GEODETIC SURVEY 1945 (RAM)

CY0710'STATION IS ABOUT 7 MILES (AIR LINE) S OF SAFFORD. IT IS

CY0710'AT THE JUNCTION OF THE SWIFT TRAIL WITH U.S. HIGHWAY 666.

CY0710'

CY0710'TO REACH THE STATION FROM THE BUENA VISTA HOTEL IN SAFFORD,

CY0710'GO S AND E ON U.S. HIGHWAY 70 FOR 0.3 MILE TO THE JUNCTION

CY0710'OF U.S. HIGHWAYS 70 AND 666. TURN RIGHT (S) AND GO 7.1

CY0710'MILES TO SWIFT TRAIL JUNCTION. TURN LEFT OFF THE HIGHWAY

CY0710'GOING THROUGH GATE AND THEN GO N ALONG THE E SIDE OF THE

CY0710'FENCE FOR 90 FEET TO STATION. TO REACH THE AZIMUTH MARK

CY0710'TAKE THE SWIFT TRAIL (MACADAM ROAD GOING SW) FOR 3.3 MILES

CY0710'FROM THE SWIFT TRAIL JUNCTION. HERE TAKE A ROAD TURNING

CY0710'OFF TO THE RIGHT FOR 0.1 MILE. THE AZIMUTH MARK IS ABOUT

CY0710'250 FEET N OF HERE.

CY0710'

CY0710'STATION IS 79 FEET ENE OF THE CENTER OF THE NEAREST POINT

CY0710'ON THE SWIFT TRAIL, 59 FEET ENE OF THE CENTER LINE OF U.S.

CY0710'HIGHWAY 666, AND 90 FEET NNW OF THE CENTER OF A DIRT ROAD

CY0710'RUNNING E FROM U.S. HIGHWAY 666. IT IS 24-1/2 FEET N OF

CY0710'A 4 INCH SQUARE WHITE WITNESS POST SET IN THE WIRE RIGHT-OF-WAY

CY0710'FENCE AND 8-1/2 FEET ENE OF THE WIRE RIGHT-OF-WAY FENCE.

CY0710'IT IS MARKED BY A BRONZE STATION DISK SET IN A SQUARE CONCRETE

CY0710'POST WHICH PROJECTS 1 INCH ABOVE THE GROUND AND IS STAMPED

CY0710'SWIFT 1945. UNDERGROUND MARK - 7A.

CY0710'

CY0710'REFERENCE MARK 1 IS ENE OF THE STATION AND AT ABOUT THE CY0710'SAME LEVEL. IT IS A BRONZE REFERENCE DISK SET IN A SQUARE CONCRETE POST WHICH PROJECTS 2 INCHES ABOVE THE GROUND. IT CY0710'IS STAMPED SWIFT NO 1 1945.

CY0710'

CY0710'REFERENCE MARK 2 IS NNW OF THE STATION AND AT ABOUT THE CY0710'SAME LEVEL. IT IS 3-3/4 FEET ENE OF THE RIGHT-OF-WAY FENCE. CY0710'IT IS A BRONZE REFERENCE DISK SET IN A SQUARE CONCRETE POST WHICH PROJECTS 3 INCHES ABOVE THE GROUND AND IS STAMPED CY0710'SWIFT NO 2 1945.

CY0710'

CY0710'AZIMUTH MARK IS 3 MILES SW OF THE STATION, ABOUT 50 FEET CY0710'HIGHER, AND ABOUT 250 FEET N OF THE END OF TRUCK TRAVEL. CY0710'IT IS 6 FEET NE OF A 4 INCH SQUARE WHITE WITNESS POST. IT CY0710'IS A BRONZE AZIMUTH DISK SET IN A DRILL HOLE IN A BOULDER CY0710'WHICH PROJECTS 3 FEET ABOVE THE GROUND AND IS STAMPED SWIFT CY0710'1945.

DN3667
 DN3667
 DN3667 The horizontal coordinates were established by GPS observations
 DN3667 and adjusted by the National Geodetic Survey in June 2012.
 DN3667
 DN3667 NAD 83(2011) refers to NAD 83 coordinates where the reference frame has
 DN3667 been affixed to the stable North American tectonic plate. See
 DN3667 [NA2011](#) for more information.

DN3667
 DN3667 The horizontal coordinates are valid at the epoch date displayed above
 DN3667 which is a decimal equivalence of Year/Month/Day.
 DN3667
 DN3667 The orthometric height was determined by GPS observations and a
 DN3667 high-resolution geoid model using precise GPS observation and
 DN3667 processing techniques.
 DN3667
 DN3667 Significant digits in the geoid height do not necessarily reflect accuracy.

 DN3667
 DN3667 The X, Y, and Z were computed from the position and the ellipsoidal ht.
 DN3667
 DN3667 The Laplace correction was computed from DEFLEC12B derived deflections.
 DN3667
 DN3667 The ellipsoidal height was determined by GPS observations
