REPORT OF SURVEY

USGS FEMA LiDAR

LOWER BLACK WATERSHED, JEFFERSON AND WASHINGTON COUNTIES ARKANSAS

INTRODUCTION

Terrasurv Inc. was tasked by Fugro-Earthdata International to perform a control survey in support of LiDAR data collection of the three separate areas in Arkansas: Lower Black Watershed (Arkansas and Missouri), and Jefferson and Washington Counties. The Global Positioning System (GPS) was used in a static differential mode to establish the control networks. The map in figure 1 shows the location of the surveys. Each site was processed independently of the others.

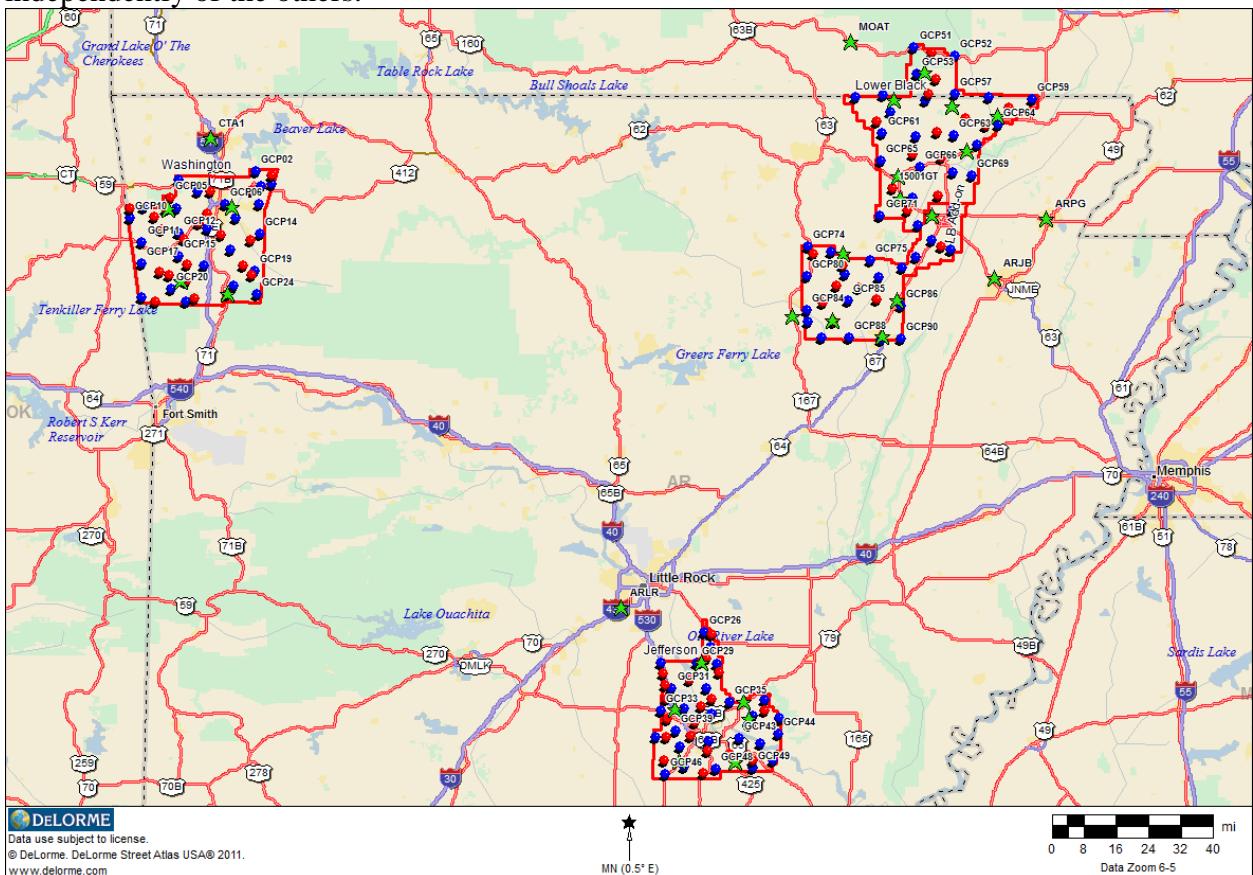

Figure 1

On the map above, the 93 LiDAR ground control points (GCP01-GCP90) are shown by blue dots, the 63 LiDAR check points are shown as red dots and the location of the CORS and the temporary base stations are shown as green stars. Each of these areas is shown in more detail in figures 2 through 4 below.

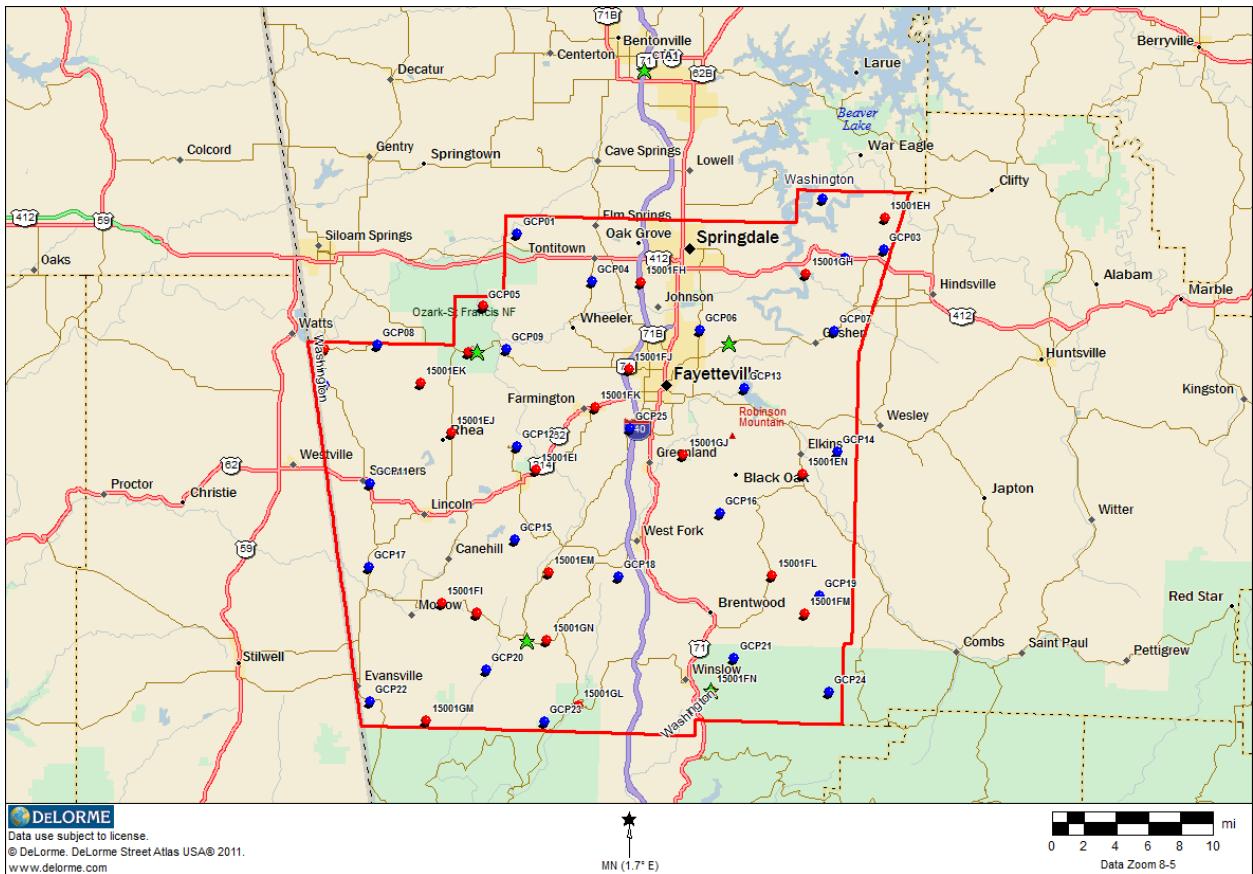

Figure 2 Washington County

On the map above, the twenty-six LiDAR points (GCP01-GCP25) for Washington County are shown by blue dots, the 21 LiDAR check points are shown as red dots and the location of the CORS and the temporary base stations are shown as green stars.

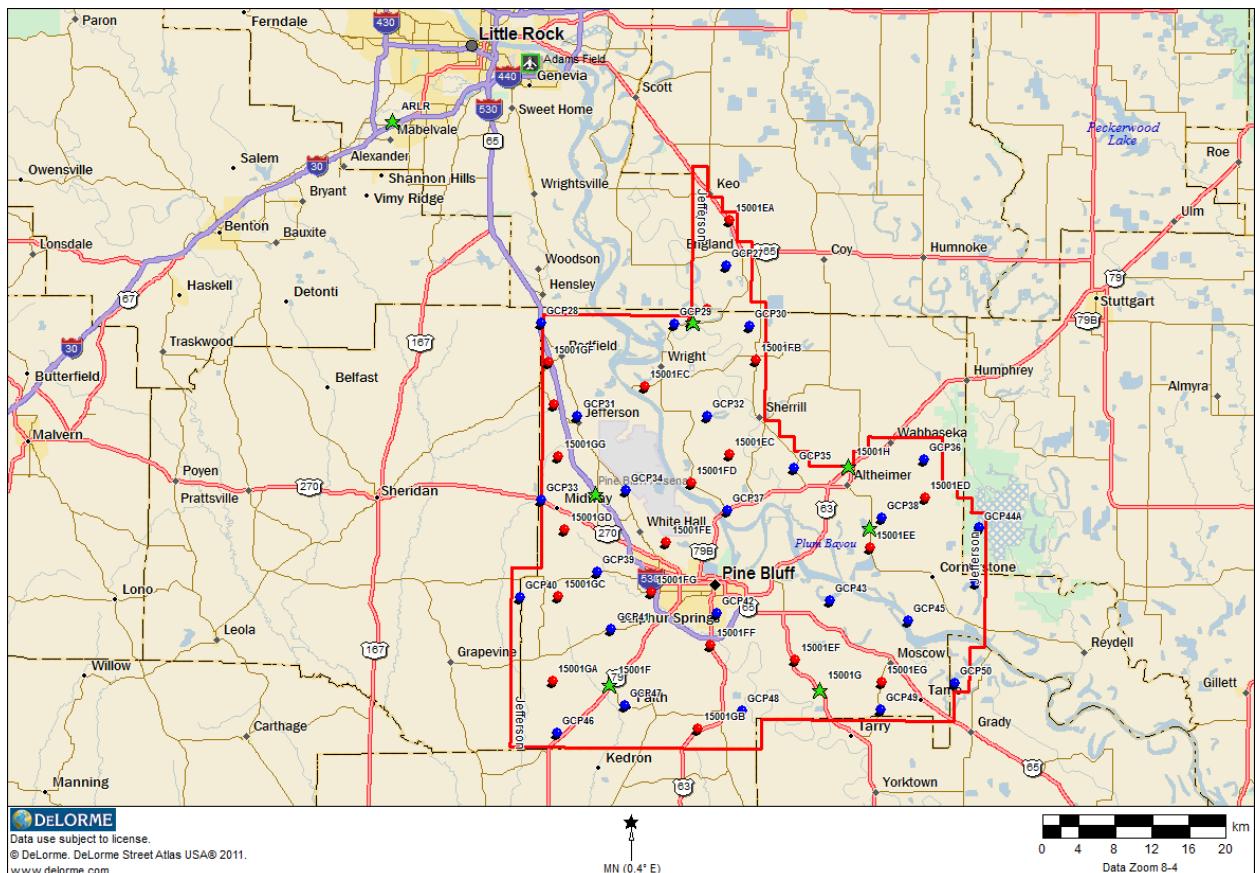

Figure 3 Jefferson County

On the map above, the twenty-six LiDAR points (GCP26-GCP50) for Jefferson County are shown by blue dots, the 21 LiDAR check points are shown as red dots and the location of the CORS and the temporary base stations are shown as green stars.

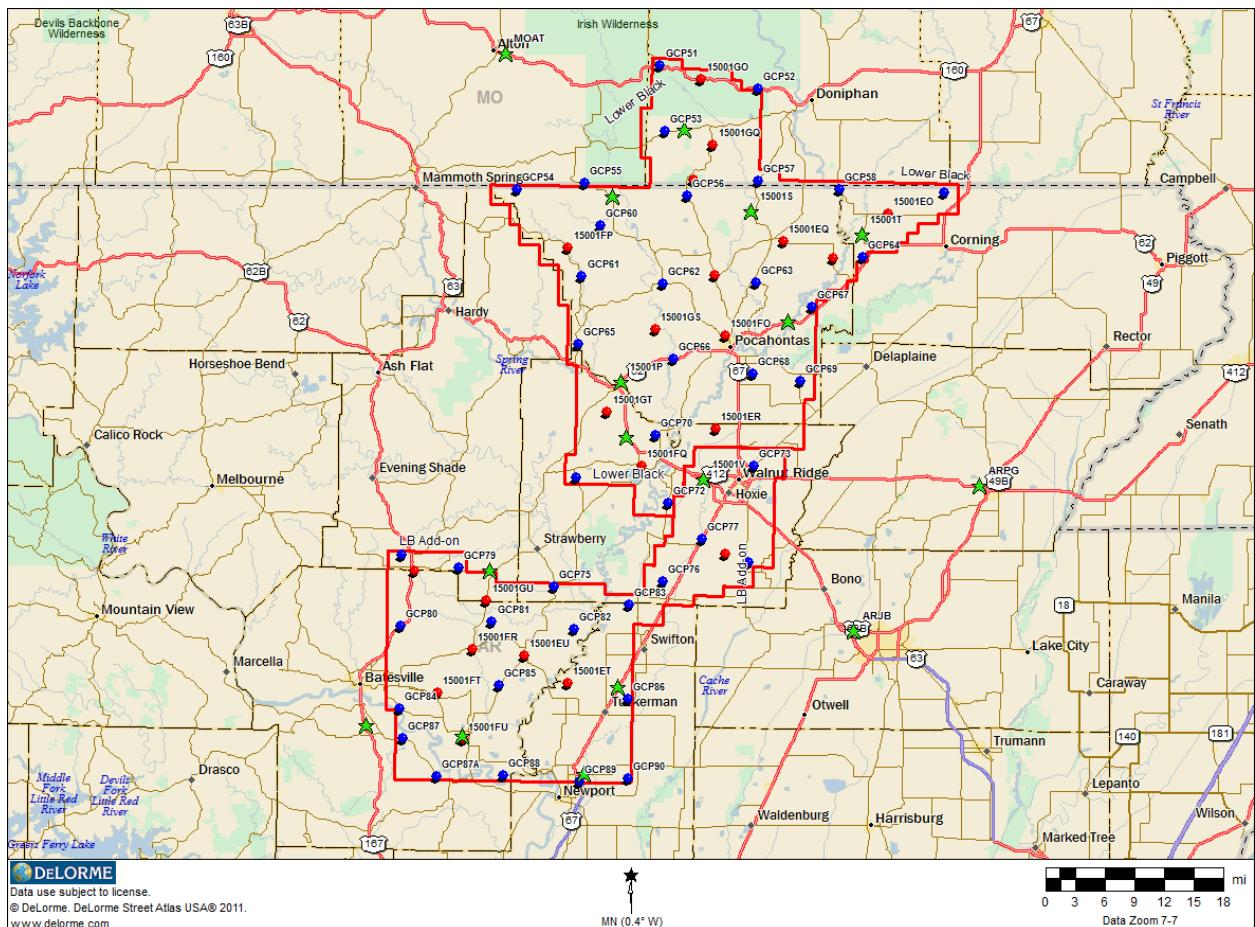

Figure 4 Lower Black River Watersheds

On the map above, the forty-one LiDAR points (GCP51-GCP90) for the Lower Black Watershed are shown by blue dots, the 21 LiDAR check points are shown as red dots and the location of the CORS and the temporary base stations are shown as green stars.

CONTROL

The National Spatial Reference System (NSRS) was used to provide control for the network. Six CORS stations provided the ties between the NSRS and the new stations. The following table summarizes the NSRS stations:

Name	CORS ID	PID	Site
BATESVILLE CORS ARP	ARBT	DH8992	Lower Black
JONESBORO CORS ARP	ARJB	DO9379	Lower Black
PARAGOULD CORS ARP	ARPG	DH7109	Lower Black
MODOT ALTON CORS ARP	MOAT	DN6073	Lower Black
LITTLE ROCK CORS ARP	ARLR	DH7107	Jefferson
CRAFTON TULL COOP CORS ARP	CTA1	DG9661	Washington

The horizontal datum was the North American Datum of 1983 (2011). The vertical datum was the North American Vertical Datum of 1988 (NAVD 1988). The GEOID12A model was used to obtain NAVD 1988 orthometric heights from the GRS 1980 ellipsoidal heights.

WASHINGTON COUNTY STATIONS

The 26 newly surveyed LiDAR control points were a combination of cut grass, sparse grass, and bare ground. The 21 newly surveyed LiDAR check points were 7 points in bare or open terrain, 7 points in tall brush or crops and 7 points in the woods. The table below summarizes the new stations:

Station Name	GPSID	USGS Quad	Description
GCP01	15001AA	ROBINSON	cut grass, on the north side of Osage Creek Road & west side of Logan Road
GCP02	15001AB	SPRING VALLEY	sparse grass, on the north side of The Pines Road in the center of a dirt drive headed north
GCP03	15001AC	SPRING VALLEY	grass, west shoulder of SR303
GCP04	15001AD	SPRINGDALE	cut grass, on the west side of CR709 in the north east corner of a private lot
GCP05	15001AE	ROBINSON	sparse, on the east side of Robinson Road just south of the Illinois River

GPS DATA PROCESSING

The data was downloaded to a PC and processed using Trimble Business Center, version 3.40. All of the lines between the CORS and the temporary base stations were processed, and selected lines from the nearest CORS or temporary base were processed to each new station. The single baseline method was used, with the precise ephemeris. All of the baselines were integer bias fixed solutions. The baselines to be processed were manually selected, based on proximity to nearby CORS or temporary base. The table below shows the results of the baseline processing:

All of the processed baselines had acceptable statistics.

In addition to the static observations, three stations were positioned using Real Time Kinematic methods from a nearby temporary base, which was processed as a static base. RTK observations were also made between the intervisible station pairs used to establish the woods check stations. The table below summarizes the RTK observations:

The 21 woods check points (7 for each of the three areas) were surveyed using a total station. A single GPS station was positioned by static methods. An intervisible station was then positioned from the static station by RTK. A Trimble S6 total station was then used to survey from the pair of points to the check point in the woods.

LEAST SQUARES ADJUSTMENTS

The data was adjusted using GEOLAB, a least squares adjustment program from Microsearch Corp. The processed static baselines and RTK vectors were parsed to form an input file. No scaling of the apriori baseline statistics was done. Station errors (HI and centering) of 0.005 m were also included. Geoid separations for each station were interpolated using the GEOID12A model. Each of the three areas was adjusted separately, as there were no stations in common.

The west area (Washington County) adjustment constrained the CORS CTA1 in all three dimensions (latitude, longitude and ellipsoidal height). The estimated variance factor for this adjustment was 1.33. The table below shows the 2-D and 1-D Station Confidence Regions (95.000 percent, in meters) for the stations in the west network:

SUMMARY

Ninety-three LiDAR ground control points and sixty-three check points were positioned at three areas in Arkansas and southern Missouri. The estimated accuracy of the adjusted coordinates is ± 0.05 m with respect to the NAD 1983 (NSRS2011) and NAVD 1988 datums.
