	c) NGS Data Sheets for Project Control	

1. INTRODUCTION

1.1 Project Summary

Dewberry Consultants LLC is under contract with the United States Geological Survey (USGS) to collect and process LiDAR for Southeast Florida. This survey will be used to evaluate the vertical accuracy of the bare-earth terrain derived from LiDAR. The project area consists of approximately 1,641 square miles. In support of this project Dewberry surveyed 125 independent check points. As part of this work, Dewberry staff will complete a Control Survey of independent check points that will be used to test the accuracy of the LiDAR and derivative products. The field work was conducted from May 30, 2018 – January 18, 2019.

Existing National Geodetic Survey (NGS) control points were located and surveyed to check the accuracy of the RTK/GPS survey equipment with the results shown in Section 2.4 of this Report.

As an internal QA/QC procedure and to verify that the independent check points meet the 95% confidence level approximately 50% of the points were re-observed and their corresponding coordinate differences are shown in Section 5 of this report.

A map showing the overall project area is shown in section 1.3. Final horizontal coordinates are referenced to both the Contiguous USA Albers Coordinate System, NAD 83 (2011 Adjustment) in meters and the Florida State Plane Coordinate System, East Zone, NAD83 (2011 Adjustment) in U.S. Survey feet. Final vertical elevations are referenced to NAVD88 in both meters and U.S. Survey feet using Geoid model 2012B (Geoid12B).

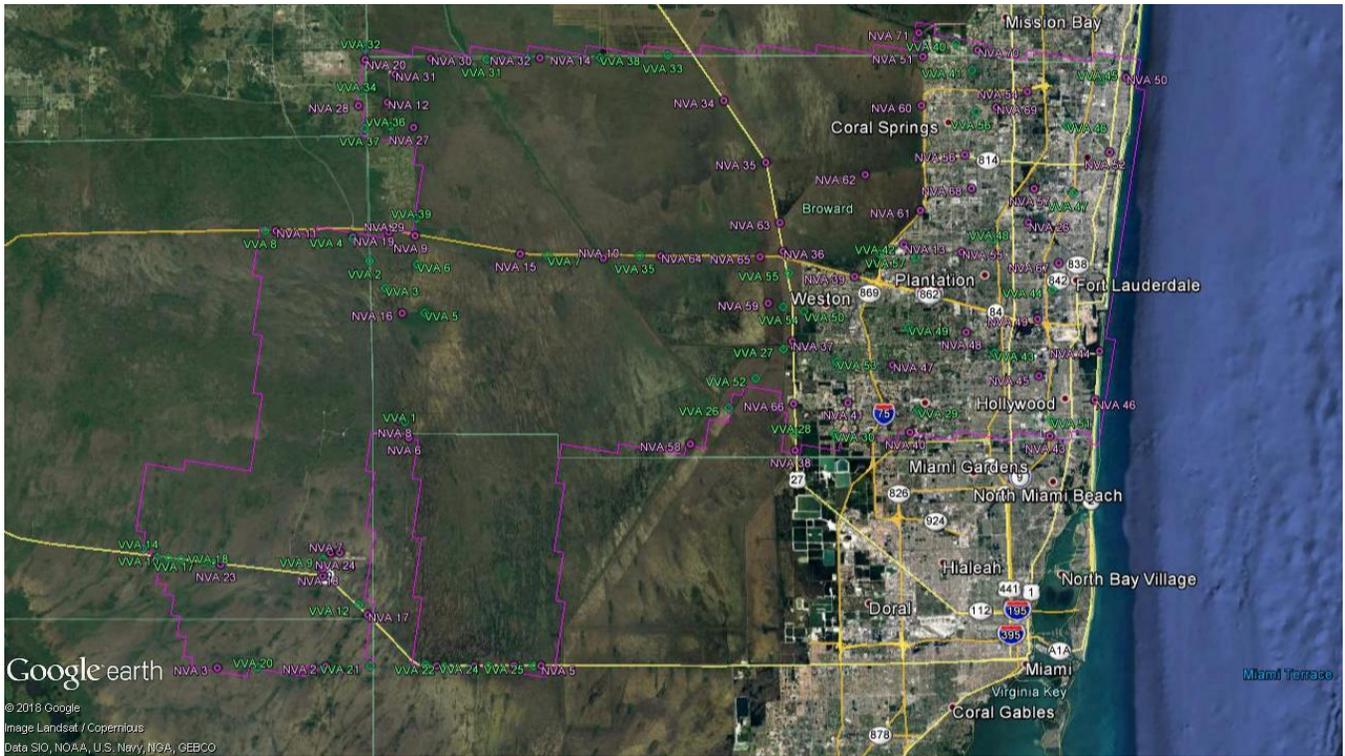

1.2 Point of Contact

Questions regarding the technical aspects of this report should be addressed to:

Dewberry Engineers, Inc.

1.3 Project Area

Project Limits and Independent Check Point Locations

COMPANY CONFIDENTIAL AND PROPRIETARY: Use or disclosure of data contained on this sheet is subject to restriction on the title page of this proposal.

2. PROJECT DETAILS

2.1 Survey Equipment

A Spectra Precision SP80 GPS receiver and a TOPCON GR5 GPS receiver were used to perform the survey observations. A two meter fixed height pole and bi-pod legs were used to mount and stabilize the receiver. A Spectra Precision Ranger 3 Data Collector was used to collect and store the data. Both GPS units are geodetic-quality dual-frequency GPS receivers.

2.2 Survey Point Details

The 125 LiDAR independent check points were well distributed throughout the project area by pre-selecting them in the office using aerial imagery. The American Society for Photogrammetry and Remote Sensing (ASPRS) guidelines were followed for point selection as closely as possible. The independent check points consist of two classifications: Non-vegetated Vertical Accuracy (NVA) and Vegetated Vertical Accuracy (VVA) points. There are a total of 69 NVA points consisting of bare earth/open terrain and urban points. There are a total of 56 VVA points consisting of tall weeds/crops, brush lands and forested land covers. A sketch was made for each check point location and a nail & disk or an iron rod & cap were set at the point. The independent check point locations are detailed on the “Final Coordinates List” attached to this report.

2.3 Network Design

Two real-time kinematic (RTK) networks were used to establish and verify the accuracy of the observations. The Trimble VRS Now Network and the Florida Permanent Reference Network (FPRN) were used for the observations. The GPS units connected to the networks using a cellular connection and a virtual reference station. The RTK networks provide instant access to RTK corrections utilizing a network of permanent (fixed) continuously operating reference stations. The published accuracy for the networks are less than 2 centimeters. All recorded observations were within 5 centimeters of each other. These observations were averaged to produce the final coordinate value for the ground control points.

2.4 Field Survey Procedures and Analysis

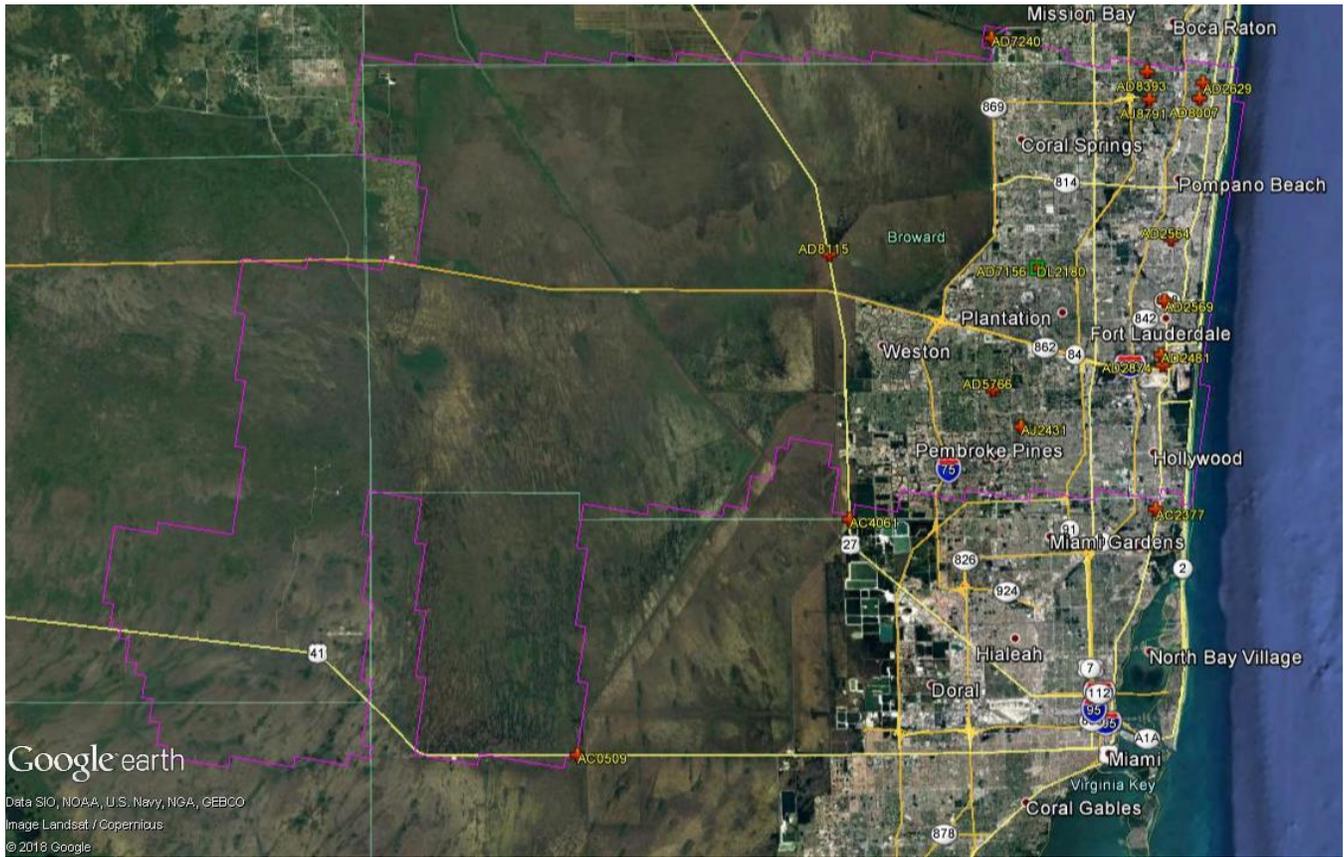

All locations were occupied once with approximately 50% of the locations being re-observed. All re-observations matched the initially derived station positions within the allowable tolerance of ± 5 centimeters or within the 95% confidence level. Each occupation was approximately 1.5 minutes in duration and measured to 90 epochs. The second observation occurred at least four hours after the first observation.

Seventeen (17) existing National Geodetic Survey (NGS) control points with published coordinates were located as an additional QA/QC method to check the accuracy of the networks. A NGS control point was located at the beginning and end of each day to ensure measurement quality. The checks all individually conformed to the required accuracy and the average coordinates for the surveyed NGS control points are shown below and compared to the published coordinates.

NGS PT. ID	Designation	As Surveyed (ft)			Published (ft)			Differences (ft)

2.5 Adjustment

Adjustment is not necessary for the survey data collected using the RTK GPS Trimble VRS Now Network and the Florida Permanent Reference Network. Both networks are designed to provide final processed coordinates, enabling high-accuracy positioning in real time across a geographic region. Both networks use real-time data streams from the system users and generate correction models for high-accuracy RTK GPS corrections throughout the networks. These corrections are applied to the points as they are being collected, negating the need for a post-process adjustment.

2.6 Data Processing Procedures

After the field data is collected the information is downloaded from the data collectors. Downloaded data is processed in the office to obtain the following reports: points list, point derivations and a vector spreadsheet. The reports are reviewed for point accuracy and precision.

After review of the point data an “ASCII” or “txt” file is created. Point files are loaded into AutoCAD Civil 3D to make a visual check of the point data (Point #, Coordinates, Elevation, and Description). The data is then organized using Excel spreadsheets and imported into the report.

6. SURVEY NOTES

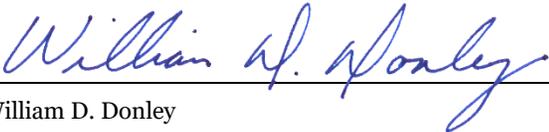

- 1) Coordinates shown hereon are based on both the Contiguous USA Albers Coordinate System, North American Datum of 1983 (2011 Adjustment) in meters and the Florida State Plane Coordinate System, East Zone, North American Datum of 1983 (2011 Adjustment) in U.S. Survey feet.
- 2) Elevations shown hereon are based on the North American Vertical Datum of 1988, in both meters and U.S. Survey feet.
- 3) The purpose of this survey was to establish independent check points across Southeast Florida to test the accuracy of the LiDAR data and derivative products.

7. GLOSSARY/LEGEND

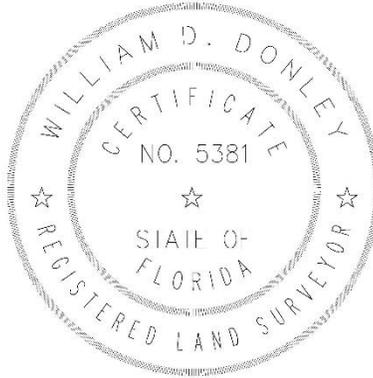

CHK	Check
ELEV	Elevation
FPRN	Florida Permanent Reference Network
ft	feet
GPS	Global Positioning System
ID	Identification
LiDAR	Light Detection and Ranging
LS	Land Surveyor
m	Meter
NAD	North American Datum
NAVD	North American Vertical Datum
NGS	National Geodetic Survey
NVA	Non-vegetated Vertical Accuracy
QA/QC	Quality Assurance/Quality Control
RTK	Real Time Kinematic
RTN	Real-Time Network
SPC	State Plane Coordinate
USGS	United States Geological Survey
VRS	Virtual Reference System
VVA	Vegetated Vertical Accuracy

8. SURVEYOR'S CERTIFICATION

I hereby certify this survey report meets the applicable "Standards of Practice" as set forth by the Florida Board of Professional Surveyors and Mappers in rule 5J17.050-.052, Florida Administrative Code.

William D. Donley
Florida Licensed Surveyor & Mapper No. LS 5381

03-27-2019

Date

This Survey is not valid without the signature and original raised seal of a Florida Licensed Surveyor and Mapper.

Certificate of Authorization No. LB8011
