Gratiot County, MI QL-2 Aerial LiDAR
Surveyor's Report for Ground Control Establishment

Project Description:

The Spicer Group was contracted to field survey LiDAR calibration control points and quality control points in support of Gratiot County, MI QL2 LiDAR. There are 20 calibration points in which the locations were provided by Quantum Spatial, 40 non-vegetated (NVA) points and 30 vegetated (VVA) points throughout the project for a total of 90 points. The land cover breakdown has the NVA points as 5 bare earth and 35 urban area. VVA points are broken down as 3 Forested, 3 swamp/wetland points, and 24 tall weeds/crops. Fifty percent of the NVA points can be used for horizontal accuracy verification.

The VVA and NVA points were placed throughout the county to try and provide maximum coverage while adhering to the LiDAR Base Specification Version 1.2 (November, 2014). Gratiot County has a tremendous amount of farmland and those fields were being prepared for seeding while field surveying activities were ongoing. VVA points were placed at points where they would not be disturbed by farm work. NVA points were placed throughout the county also.

Field Procedure:

Field work began on May 12th, 2015 and was completed on May 26th, 2015. A RTK GPS survey was performed using Leica GS14 GNSS receivers utilizing the Michigan Department of Transportation (MDOT) Continuously Operating Reference Stations (CORS) as base stations for the project. Each point was set on a flat surface at least five meters away from any significant elevation change. Points were occupied for 20 seconds, the unit was then rotated 180 degrees and occupied for 20 more seconds. Second, crews forced a loss of phase lock, and reacquired a fixed solution under a new set of ambiguities. The point was then occupied for 20 seconds, the GNSS receiver was again rotated 180 degrees and occupied for another 20 seconds. This procedure was completed twice on all control and QC points for this project with a minimum of 4 hours of separation between each set of observations. Any of the QC points that were unable to be collected with GPS were located conventionally with a Leica TS15 Robotic Total Station utilizing points previously established with GPS. A closed traverse was then run to tie in the conventional point, in order to analyze 3D traverse closures. Data sheets for each point were completed, which include point type, general location, occupation time, equipment used, and photographs. Final coordinates, point ties, and final RMSE values.

Office Procedure:

Upon completion of the field survey, all RTK observations were imported into Leica Geo Office (LGO) for processing and analysis. All redundant observations were reviewed in LGO for agreement and consistency. Observations averaging limits were set to 0.08' in XY & Z, and any points where multiple observations exceeded the 0.08' deviation from the mean, were observed for a third set of observations. All final observations for all points from a minimum of two sets agree to within 0.08' of the mean in 3D position.

Final 3D coordinate values are the result of a least squares adjustment performed on the RTK network. The six CORS stations used were held as 3D constraints in the final adjustment.

Reporting Procedure:

The North American Datum of 1983 (NAD83 (2011)), Michigan South Zone projection was used for reporting the horizontal coordinates in international feet. The vertical elevations are North American Vertical Datum of 1988 (NAVD 88) utilizing the GEOID12A model and are reported in international feet.

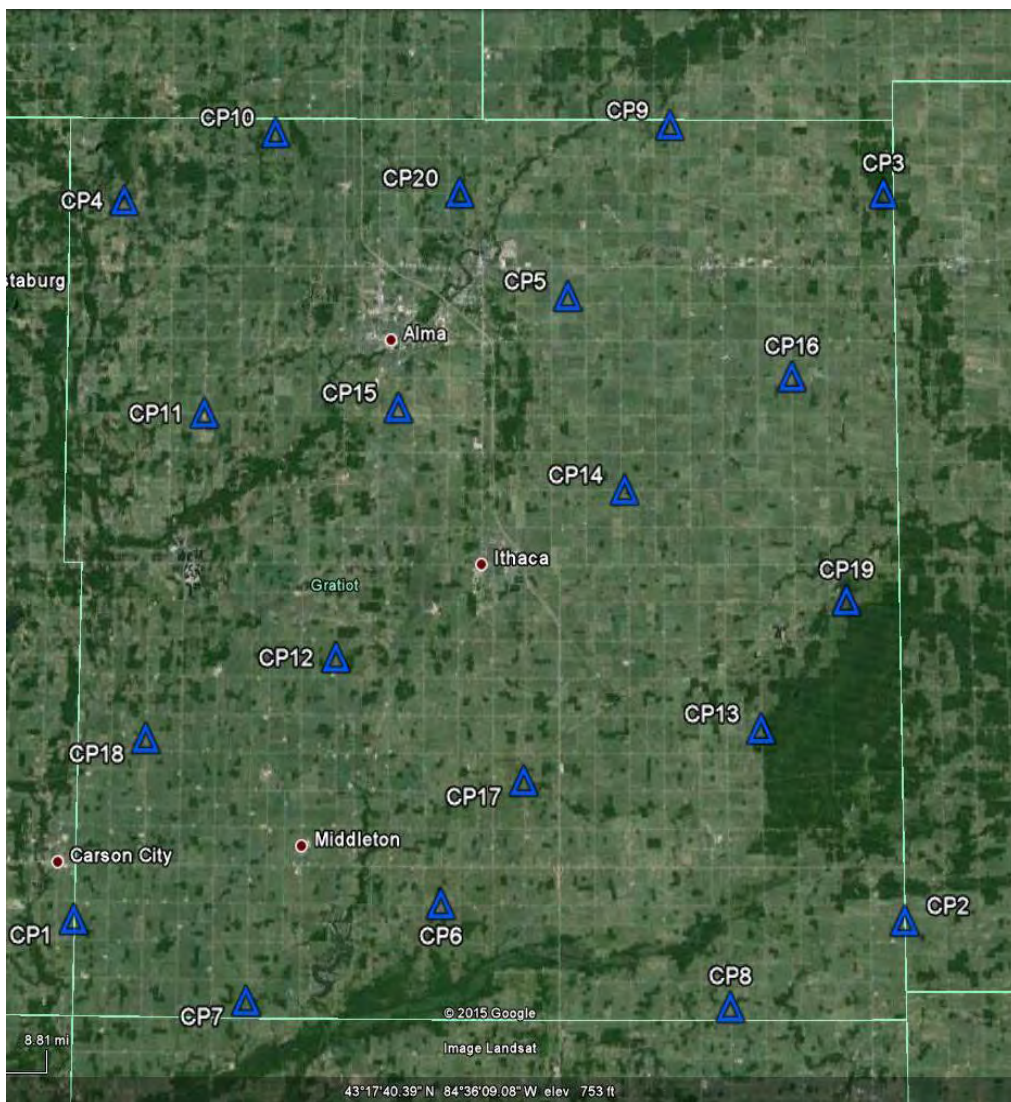

The average Horizontal RMSE for all points at the 95% confidence level is 0.04 international feet or 0.011 meter.

The average Elevation RMSE for all points at the 95% confidence level is 0.02 international feet or 0.006 meter.

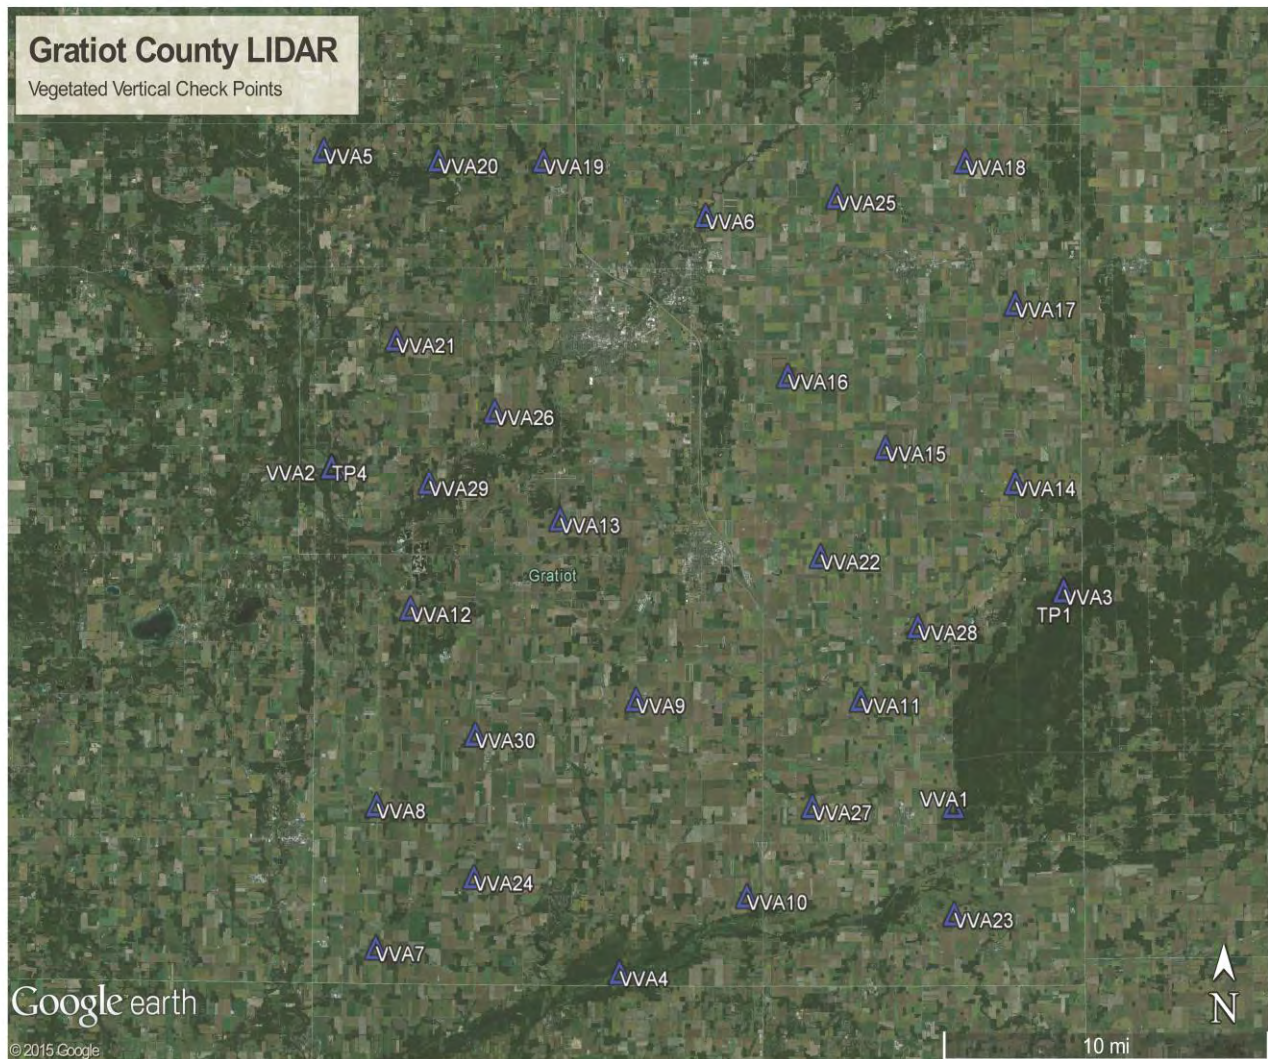

The average 3-Dimensional RMSE for all points at the 95% confidence level is 0.06 international feet or 0.017 meter.
