Introduction

Quantum Spatial, Inc. was contracted by USGS under task order G15PD01036 to Survey LiDAR calibration and quality control points in support of NRCS-Pike & Scott Counties. This is the report of the technical approach used and detail of each point surveyed.

Project Area

The Project Area, shown in the figure below, consists of approximately 2,783 square kilometers.

Technical Approach to Land Cover Validation Point Selection

Referencing ASPRS Positional Accuracy Standards for Digital Geospatial Data (Edition 1, Version 1.0, - November, 2014) table C.1 Recommended Number of Checkpoints based on Area, Quantum Spatial calculated that 58 Non-Vegetated Vertical Assessment (NVA) and 47 Vegetated Vertical Assessment (VVA) points are required for this project area.

To ensure that checkpoints were distributed generally proportionate among the various vegetated land cover types, Quantum Spatial used existing USGS Land Cover data to divide both the NVA and VVA categories among the various types, calculating the approximate number of required points in each representative type proportionate to the total project area. The resulting point classes are detailed below:

NVA Class	# of Points	VVA Class	# of Points
Bare Earth	6	Forested	15
Urban Area	52	Tall Weeds/Crops	32

Given that approximately 1/2 of the NVA check points should also be used for horizontal accuracy testing, but that it is commonly understood that good vertical check points do not generally make for good horizontal check points, Quantum Spatial has required that 24 horizontal check points shall be used for this project, whether they are used for NVA validation, or are entirely separate. These locations have been reported under their own chapter in this report.

Quantum Spatial has adopted the philosophy that each vegetative class must be well distributed throughout the project area. While points in varying classes may be near to one another, points of a single vegetative class may not. Proposed point locations are selected with this distribution methodology in mind.

Survey Accuracy Requirements

Given that the survey accuracy of calibration and quality control check points should be 3 times more accurate than the required accuracy of the data set, Quantum Spatial requires that calibration and NVA points be better than 3 centimeters (0.10ft), both horizontally and vertically, and that VVA points be better than 5 centimeters (0.16ft), both horizontally and vertically. The surveyed accuracy of each point must be determined through redundant measurements and/or network adjustment using procedures and methodologies that reliably and consistently result in the aforementioned accuracies.

Due to variances in reference control accuracy and adjustment, Quantum Spatial requires that the survey methodology used be explained, so that it can be repeated if necessary.

Field Survey Methodology

Date Range: November 14, 2015 – January 13, 2016

Equipment Used:

Leica GS15 dual frequency GNSS receivers and a Trimble M3 DR 2" Total Station

GNSS Methodology:

Points were occupied with a static base station broadcasting real time kinematic (RTK) corrections to a rover with which multiple measurements on other points were observed. The static base station data was post processed referencing NGS continuously operating reference stations and a weighted adjustment was performed to obtain base station coordinates. The adjustment was performed using Leica Geo Office. For forested points, a secondary control point with line of sight to another point was established so that the resulting pair can be occupied with a total station>

Variations from the stated GNSS methodology:

When radio RTK signals were unobtainable, points were observed with rapid static GNSS and were post processed as part of the network adjustment. The points located using this methodology were CP16, CP33, and TW32.

Total Station Methodology:

Angles and distances to forested points were doubled and the final point accuracy was determined through network adjustment using Leica Geo Office.

Overall Project Accuracy Statement

All point coordinates have been reported in the North American Datum of 1983 (NAD83 /2011), SPCS IL West, US Survey Feet. Elevations are relative to the North American Vertical Datum of 1988 (NAVD 88) which were derived using the Geoid 12B model and are reported in US Survey Feet.

Calibration Points

Average Horizontal RMSE is 0.023 ft.

Average Elevation RMSE is 0.039 ft.

NVA Points

Average Horizontal RMSE is 0.023 ft.

Average Elevation RMSE is 0.039 ft.

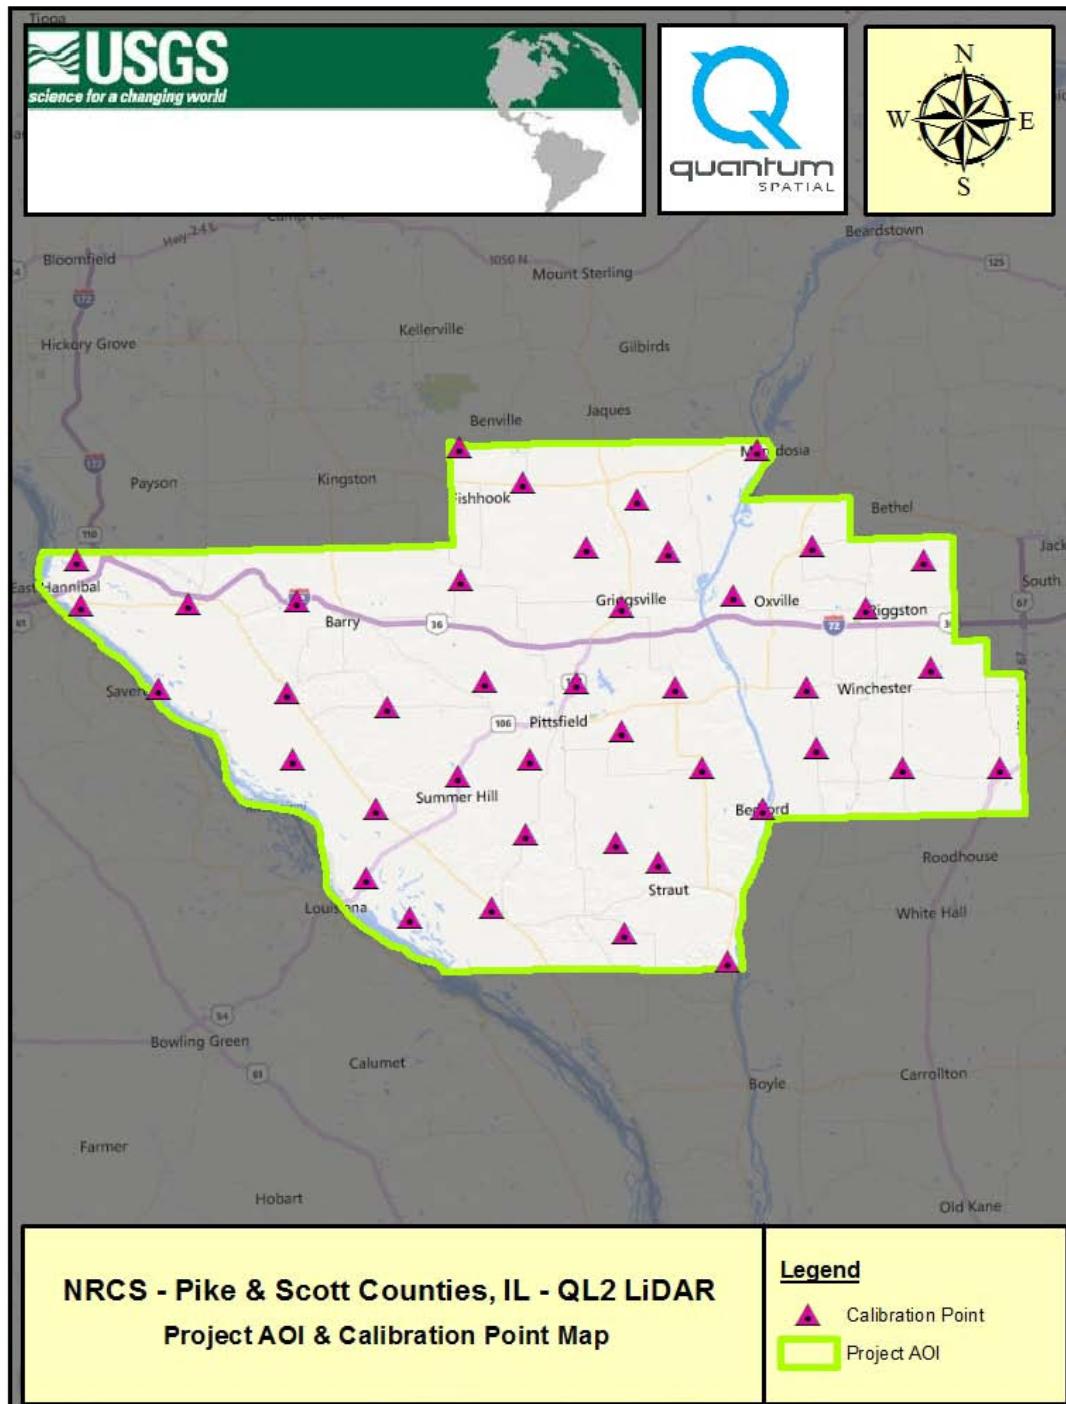

VVA Points

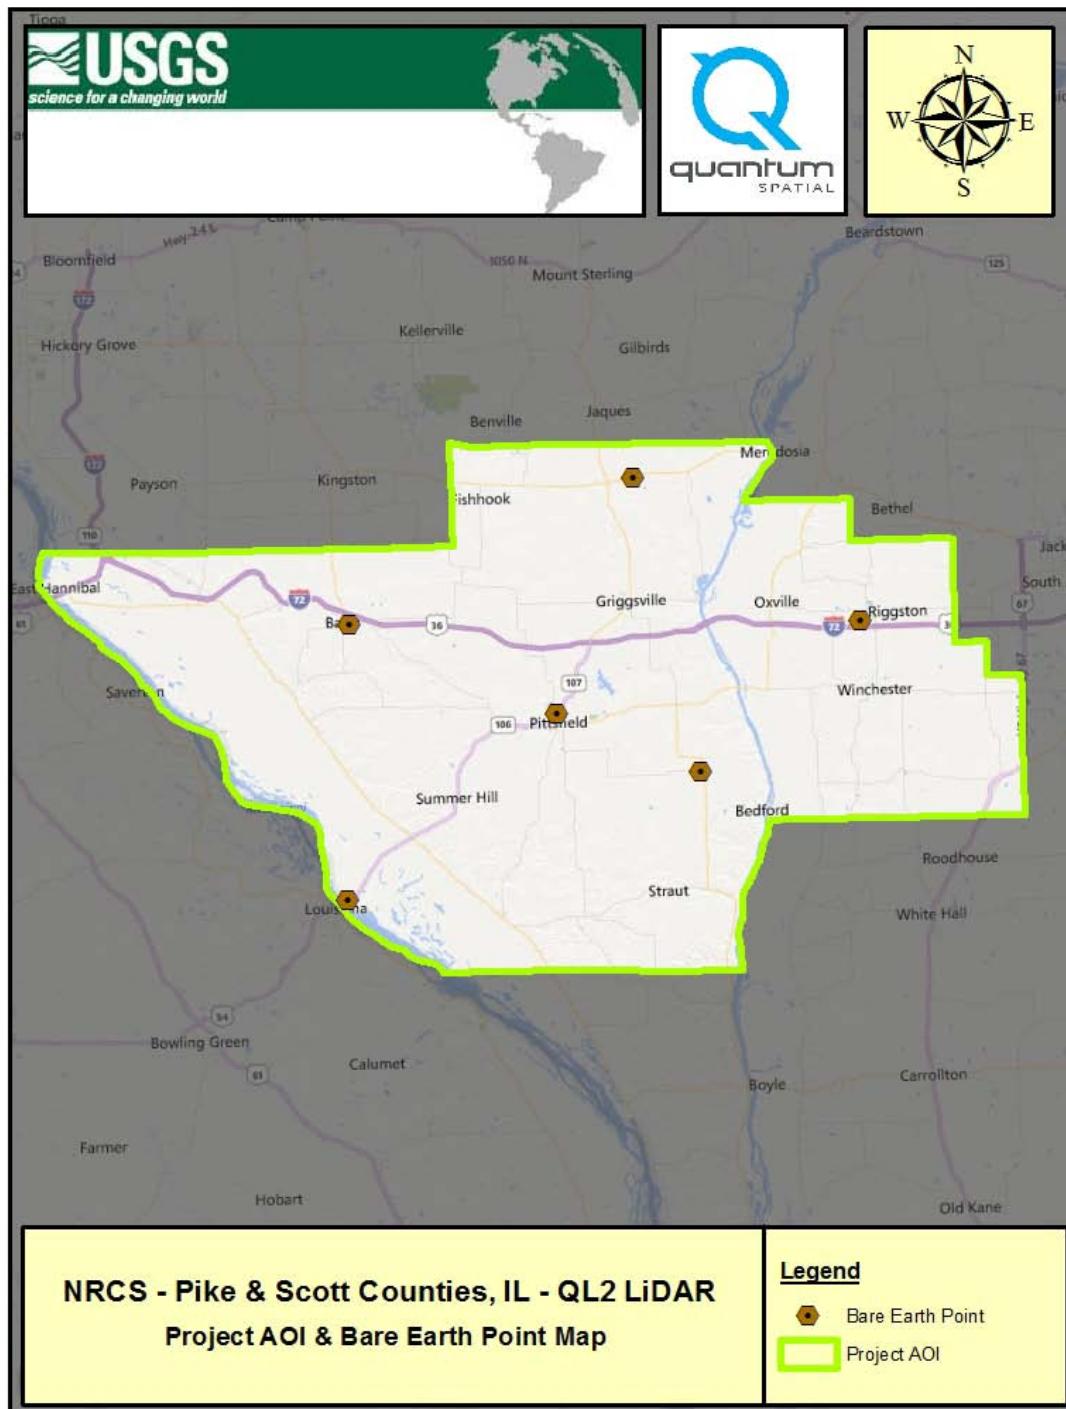

Average Horizontal RMSE is 0.029 ft.

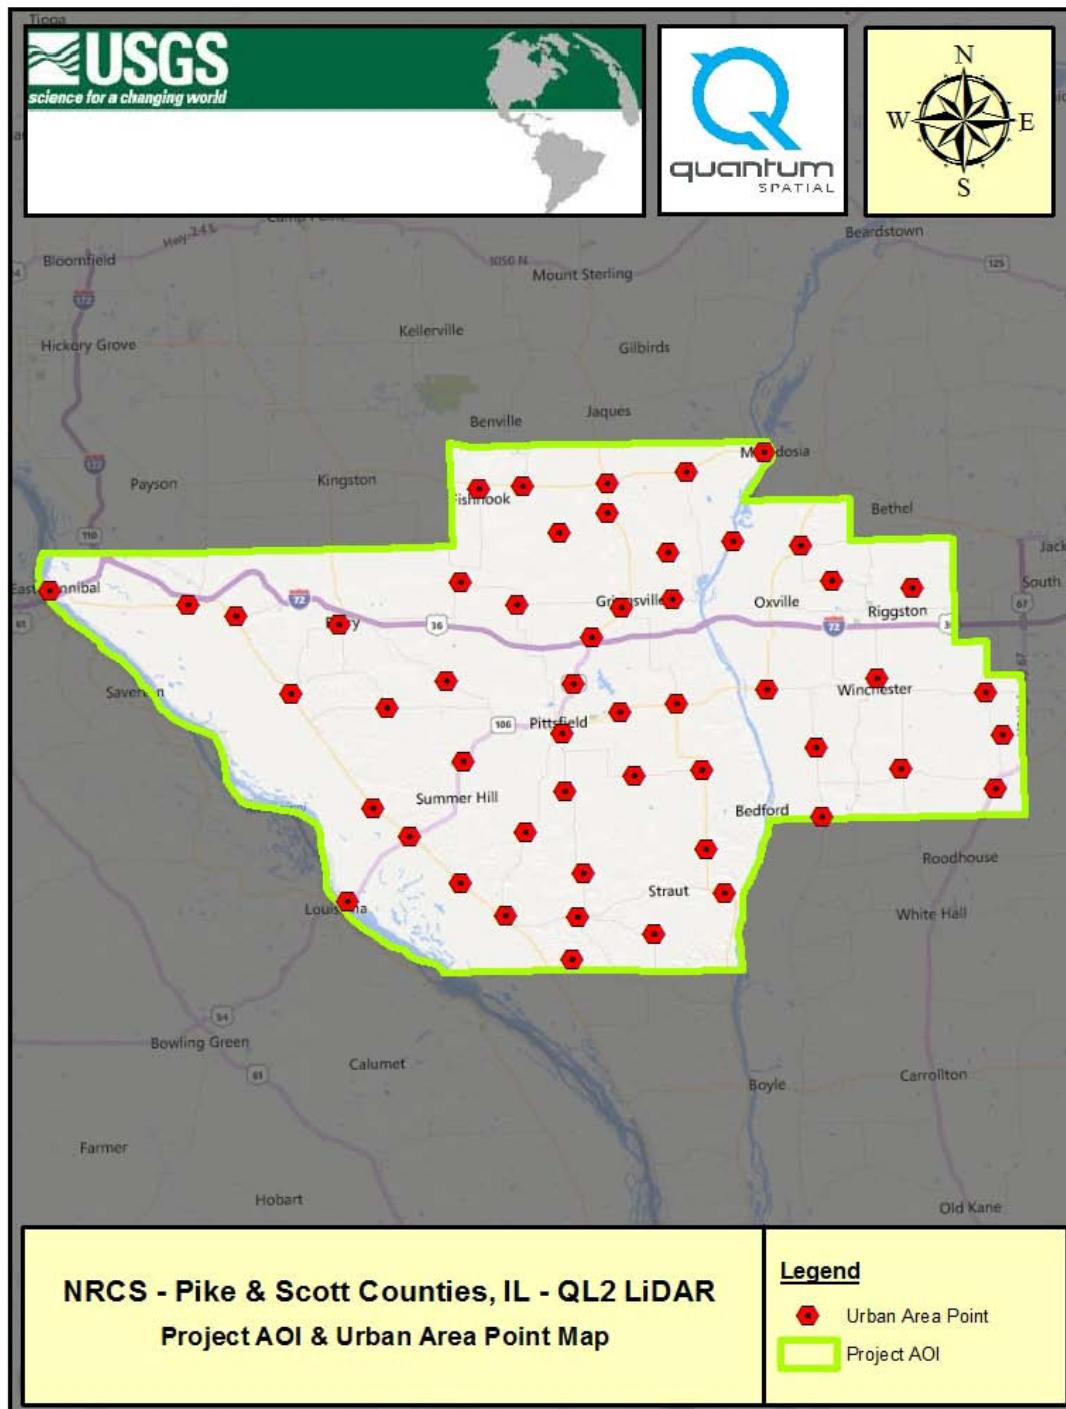

Average Elevation RMSE is 0.049 ft.
