

LiDAR Quality Assessment Report

The USGS National Geospatial Technical Operations Center, Data Operations Branch is responsible for conducting reviews of all Light Detection and Ranging (LiDAR) point-cloud data and derived products delivered by a data supplier before it is approved for inclusion in the National Elevation Dataset. The USGS recognizes the complexity of LiDAR collection and processing performed by the data suppliers and has developed this Quality Assessment (QA) procedure to accommodate USGS collection and processing specifications with flexibility. The goal of this process is to assure LiDAR data are of sufficient quality for database population and scientific analysis. Concerns regarding the assessment of these data should be directed to the Chief, Data Operations Branch, 1400 Independence Road, Rolla, Missouri 65401.

Project Materials Received

All project deliverables must be supplied according to collection and processing specifications. The USGS will postpone the QA process when any of the required deliverables are missing. When deliverables are missing, the Contracting Officer Technical Representative (COTR) will be contacted by the Elevation Section supervisor and informed of the problem. Processing will resume after the COTR has coordinated the deposition of remaining deliverables.

Metadata Review **Accepted**

Vendor provided metadata files have been parsed using 'mp' metadata parser. Any errors generated by the parser are documented below for reference and/or corrective action.

Parser can be found @ <http://geo-nsdi.er.usgs.gov/validation/>

The Project Level XML Metadata parsed select... errors.

Check if 'Best Use' metadata for NED:

The Swath XML Metadata parsed without errors.

Check if 'Best Use' metadata for NED:

The Classified XML Metadata parsed without errors.

Check if 'Best Use' metadata for NED:

The DEM XML Metadata parsed without errors.

Check if 'Best Use' metadata for NED:

The Breakline XML Metadata parsed without errors.

Check if 'Best Use' metadata for NED:

Additional
Comments:

According to version 13 one metadata file for classified, project and DEM is required. Classified and DEM metadata delivered by tile basis only. Project metadata missing. The parser was run on the tiled metadata for the classified and DEM at this time.

***Metadata files for all files were redelivered: DEM, Classed LAS, First Return, Hydro Breaklines, Intensity, Project.

***New metadata files do not exactly reflect data delivery; for example: Metadata states "Tall Grass," shapefile attribute table refers to "Long Grass"; the metadata also list extra classes not found in the point cloud: **23 Overlap - noise. Corrected by vendor.**

Based on this review, the USGS accepts the xml metadata provided.

End of Metadata Review

Vertical Accuracy Review **Accepted**

ASPRS recommends that checkpoint surveys be used to verify the vertical accuracy of LiDAR data sets. Checkpoints are to be collected by an independent survey firm licensed in the particular state(s) where the project is located. While subjective, checkpoints should be well distributed throughout the dataset. National Standards for Spatial Data Accuracy (NSSDA) guidance states that checkpoints may be distributed more densely in the vicinity of important features and more sparsely in areas that are of little or no interest. Checkpoints should be distributed so that points are spaced at intervals of at least ten percent of the diagonal distance across the dataset and at least twenty percent of the points are located in each quadrant of the dataset.

NSSDA and ASPRS require that a minimum of twenty checkpoints (thirty is preferred) are collected for each major land cover category represented in the LiDAR data. Checkpoints should be selected on flat terrain, or on uniformly sloping terrain in all directions from each checkpoint. They should not be selected near severe breaks in slope, such as bridge abutments, edges of roads, or near river bluffs. Checkpoints are an important component of the USGS QA process. There is the presumption that the checkpoint surveys are error free and the discrepancies are attributable to the LiDAR dataset supplied.

For this dataset, USGS checked the spatial distribution of checkpoints with an emphasis on the bare-earth (open terrain) points; the number of points per class; the methodology used to collect these points; and the relationship between the data supplier and checkpoint collector. When independent control data are available, USGS has incorporated this into the analysis.

Vertical Accuracy Results:

*Additional Reviewed
Vertical Accuracy
Information:*

Reviewer could not assess DEM vertical accuracy at this time. The checkpoints shapefile was delivered in UTM14 only and per liaison " USGS will want to use the UTM 15 data to match the existing tiles surrounding the project and be in the correct zone". DEM review was completed on data using UTM15. Since swath data delivered only in UTM14, reviewer was able to assess vertical accuracy using checkpoints delivered.

Check to ensure that all reported vertical accuracies for swath and DEM are consistent across metadata and reports.

***Short grass is used for FVA testing. Long Grass is referred to in the Metadata as "Tall Grass."

Based on this review, the USGS accepts the vertical accuracy.

End of Vertical Accuracy Review

Raw-Swath LiDAR Review **Accepted**

LAS swath files or raw unclassified LiDAR data are reviewed to assess the quality control used by the data supplier during collection. Furthermore, LAS swath data are checked for positional accuracy. The data supplier should have calculated the Fundamental Vertical Accuracy using ground control checkpoints measured in clear open terrain (see *Vertical Accuracy Review Section*).

Review Required: Yes No

RAW-SWATH LIDAR FILE CHARACTERISTICS

Separate folder for swath/raw LiDAR files

LAS Version: 1.2

Point Record Format: 1

- Each swath file ≤ 2 GB and properly segmented
- Correct and properly formatted georeference information is included in all LAS file headers
- Adjusted GPS time used with the global encoder id set to 1
- Scan Angles conform to USGS base-spec recommendations
- All points set to class '0' (not classified)

Additional comments:

Swath for the project was delivered as UTM14N while rest of project is UTM15N. Since this is the only swath deliverable it was assessed by reviewer.

Based on this review, the USGS accepts the swath/raw LiDAR data.

End of Swath/Raw LiDAR Review

Tiled/Classified LiDAR Review **Accepted**

Classified LAS tile files are used to build digital terrain models using the points classified as ground. Therefore, it is important that the classified LAS are of sufficient quality to ensure that the derivative product accurately represents the landscape that was measured. Classified LAS Tiles are comprised as follows, "all project swaths, returns, and collected points, fully calibrated, adjusted to ground, and classified and cut, by tiles, excluding calibration swaths, cross-ties, and other swaths not used, or intended to be used, in product generation".

Review Required: Yes No

CLASSIFIED LIDAR TILE CHARACTERISTICS

Separate folder for classified/tiled LiDAR files

LAS Version: 1.2

Point Record Format: 1

- Classified LAS tile files conform to project tiling scheme
- Quantity of classified LAS tile files conforms to project tiling scheme
- Classified LAS tile files do not overlap
- Classified LAS tile files are uniform in size
- Correct and properly formatted georeference information is included in all LAS file headers
- Adjusted GPS time used with the global encoder id set to 1
- Classified LAS tile files have no points classified as '12' (Overlap)
- Point classifications are limited to the standard values listed below:

Code	Description	Used
1	Processed, but unclassified	<input checked="" type="checkbox"/>
2	Bare-earth/Ground	<input checked="" type="checkbox"/>
7	Noise(low or high, manually identified, if needed)	<input checked="" type="checkbox"/>
8	Model key points	<input type="checkbox"/>
9	Water	<input checked="" type="checkbox"/>
10	Ignored ground (breakline proximity)	<input checked="" type="checkbox"/>
11	Withheld (if the "Withheld Bit" is not implemented in the processing software)	<input type="checkbox"/>

Additional Classes:

Class	Description
17	Overlap -- Unclassified
18	Overlap -- Bare-Earth
23	Overlap -- Noise
24	Overlap -- Water
25	Overlap -- Ignored Ground

Additional comments:

Final_1112109_Kansas_Report_1_27_2014 PDF Report states class 23 (Overlap Noise) will be used in classification scheme, however it is not listed in the point cloud statistics.

Based on this review, the USGS accepts classified/tiled LiDAR data.

End of Tiled/Classified LiDAR Review

Breakline Review Accepted

Breaklines are vector feature classes that are used to hydro-flatten the bare earth Digital Elevation Models.

Review Required: Yes No

BREAKLINE FILE CHARACTERISTICS:

- Separate folder for breakline files.
- Breaklines contain elevation values.

Elevation values stored in Geometry (ZEnabled)

Units: Meters

- Waterbody Breaklines.

Polyline Polygon

- Single elevation value per waterbody feature.
- Required.

Waterbody Elevations were created via Unknown waterbody level techniques.

Double Line Stream Breaklines (Streams Approximately > 100 ft).

Polyline Polygon
Downstream DLS Flow is Monotonic
 Required.

Single Line Breaklines.

Lines are:
 Single Line Streams
 Bridge Cuts
 Culvert Connectors
Downstream SLS Flow is Monotonic

No missing or misplaced breaklines.

ADDITIONAL COMMENTS, ERRORS, ANOMALIES, OR OTHER ISSUES:

- During QA review, reviewer noted that some rivers in the DEM have been hydro-flattened that appear to be under fifty feet bank to bank, while others have not. Please review/comment. [Corrected by vendor.](#)
- Breaklines shapefile appears to be incomplete as some hydro-flattened water features are missing breaklines. Re-delivery of breakline file needed. [Corrected by vendor.](#)
- Some bridges and culverts had breaklines while others did not (as shown below). Please comment. [This problem still exists in some locations.](#) [corrected by vendor](#)

*****some breaklines still exist where culverts have been replaced (image below)(Breakline_1)

*****some culverts have been partially removed and breaklines remain. (image below) (Breakline_and_Culvert_1)

Based on this review, the USGS accepts the breakline files.

End of Breakline Review

DEM Review **Accepted**

The derived bare-earth file(s) receive a review of the vertical accuracies provided by the data supplier, vertical accuracies calculated by the USGS using supplied and independent checkpoints (*see the prior Vertical Accuracy Review Section*), and a thorough visual review for any anomalies or inconsistencies in assessing the quality of the DEM(s).

BARE-EARTH DEM TILE CHARACTERISTICS:

- Separate folder for bare-earth DEM files

Raster File Type: IMG

Raster Cell Size: 1 Meters

Tile bit depth/pixel Type: 32_BIT_FLOAT

Interpolation or Resampling Technique: Unknown

- DEM tiles do not overlap
- DEM tiles conform to Project Tiling Scheme
- Quantity of DEM files conforms to Project Tiling Scheme
- DEM tiles are uniform in size
- DEM tiles properly edge match and free of edge artifacts

Image from Global Mapper showing tile mismatch (above) and ArcMap (below). [Corrected by vendor.](#)

Tile mismatch between DEM tiles BE_15STC8550 and BE_15STC9050. [Corrected by vendor.](#)

Other issue found:

****Boundary shapefile does not conform to data extent (just follows the boundary of the tile extent)

[Corrected by vendor](#)

- Tiles are free from Spikes and Pits
- Tiles are free from Data Holidays (*voids due to processing or collection errors*)
- Tiles do not exhibit systematic sensor error or comrowing

Anomalous error (Anomaly_9) showing different data resolution. Location: 37° 34' 18.9748" N, 95° 06' 11.3445" W
*****Not corrected, but accepted

Global Mapper error image (above) ArcMap image
*****This errors still exist. It seems to be endemic throughout the north-eastern corner of the dataset. Please
recheck (see new error images below and in error shapefile). Accepted, See explanation from vendor below.

(new)

(new)

(old)

Error identified along entire eastern edge of DEM. Location: 37° 57' 1.2367" N, 95° 07' 50.7476" W *****Not corrected

Vendor explanation of above errors:

"In the UTM15 geodatabase a shape has been added with the description of *Kansas_2012_Data_Limit*. In order to provide full tile DEMs between Kansas 2013 and Kansas 2012 project areas, Kansas 2012 data was included. The inclusion of Kansas 2012 data introduced a visible seam between the two data sets due to seasonal changes, differences between missions, and sensors. The only way to alleviate the appearance of the anomalous error would be by the removal of the Kansas 2012 data, and by providing partial tiles along the eastern boundary of Kansas 2013."

DEM tiles are properly Hydro Flattened Yes No

Waterbodies or greater are flattened

Hydro-flattening error (Hydroflatten_Needed_5). Location: 37° 45' 54.2384" N, 95° 26' 20.3021" W. Three similar errors exist. *****Corrected by vendor

Streams or greater are flattened in a downstream manner

Several hydro-flattening errors exist within the streams. Image above is representative (Water_Issue_11). 15 of these error types exist; please review river system where errors exist.

***River errors corrected by vendor

***Water issue beneath bridge. Corrected by vendor.

Tidal Boundaries/Shorelines are flattened

No missing islands or larger

Bridges/Overpasses are properly removed

Several errors exist where bridges were not removed from DEM. Above image is representative (Bridge_Removal_6). Location: 37° 34' 39.3071" N, 95° 08' 34.2986" W***Corrected by vendor

Culverts are maintained (Not Hydro Enforced)

Culvert errors in which culverts were removed from DEM and need to be added back in. Above image is representative (Culvert_29) Location: 37° 52' 41.9722" N, 95° 25' 45.0572" W. 97 of this error type exist. ***Corrected by vendor

- Depressions, Sinks, are not filled in (Not Hydro Conditioned)
- Vegetation properly removed
- Manmade structures properly removed

Buildings not removed from DEM. The above image is representative of this error type (Building_Removal_1). Location: 38° 17' 21.8901" N, 95° 14' 43.5772" W. 4 of this error type exist. [****OK, thanks for info.](#)

Tiles recommended for NED 1/3rd: Yes. No.

Tiles recommended for NED 1/9th: Yes. No.

Based on this review, the USGS accepts the DEM tiles.

End of DEM Review

Based on this review, the provided delivery Meets the Contract and/or Task Order requirements.
