REPORT OF USGS LIDAR SURVEY SOUTHEAST MARYLAND

INTRODUCTION

Terrasurv, Inc of Pittsburgh, PA was tasked by Fugro Geospatial with performing a control survey in support of LiDAR data collection in the Maryland portion of the Delmarva peninsula below Delaware which included all of Somerset, Worcester, and Wicomico counties. The project consisted of two parts: 14 ground control (calibration) points (GCP) and 110 quality control points (QC: NVA/VVA/VVAF), for a total of 124 new stations. The map in figure 1 shows the location of the Ground Control (GCP) and figure 2 shows the location of the QC points. The control symbology for figures 1 and 2 are listed in table 1. Also shown are the Continuously Operating Reference Stations used to control the network, and two existing NSRS benchmarks used as a check.

Table 1 - Map Symbology and Control Quantity

Type	Symbol	VA Quantity
Ground Control (GCP)	Green Dot	14
Non-Vegetated (NVA)	Red Dot	61
Vegetated (VVA)	Yellow X	3

CONTROL

The National Spatial Reference System (NSRS) was used to provide control for the network. The [KeyNetGPS](#) real time network (RTN) was utilized, with a total of four CORS from the system being used. The horizontal datum was the North American Datum of 1983 – NAD83 (2011), epoch 2010.0. The vertical datum was the North American Vertical Datum of 1988 (NAVD88), realized with the GEOID18 geoid model from the National Geodetic Survey (NGS). In addition, two existing NSRS benchmarks were included in the network as a check.

STATIONS

Table 2 lists the stations established in this survey, including the GCP, NVA, VVA, and VVA-F, the temporary base stations established to enable survey of VVA-F points in wooded areas, and the four CORS and two existing NSRS stations.

METHODOLOGY

The field survey was done by using two Trimble R10 dual frequency, multi-constellation GNSS receivers in a real time (RTK/VRS) mode. Corrections were obtained from the Keynet VRS network with corrections delivered over the cellular network. These corrections are applied in real time and used by the rover receiver to converge to a cm level solution. Each station was occupied once for 3 minutes (180 epochs), then re-initialized and occupied a second time immediately after the first occupation. The solutions are stored as vectors from the nearest physical CORS. The woods checkpoints (VVA-F) were located by establishing a temporary base nearby using the VRS network and then using the second R10 as a rover with corrections delivered over a radio link

(RTK). Due to a bug in the field software, the vectors from the woods bases to the woods checkpoints were stored with an additional offset of up to several meters which varied at each station. The offset was corrected in the processing. Table 3 summarizes the VRS/RTK occupations (precisions in meters). Occupations with ~~strikethrough~~ were rejected.

As mentioned, each station was occupied twice (at least) in succession. The Earth Centered Earth Fixed (ECEF) vector differences were rotated into a local horizon system (N, E, Up) for analysis,

as summarized in table 4. Stations which had observations that differed by more than 0.03 m in the vertical component were re-observed until agreement was achieved.

LEAST SQUARES ADJUSTMENTS

Geolab was used to adjust the VRS/RTK vectors. No scaling of the apriori GPS statistics was done. Station errors (centering, HI and HT) of 0.005 m were input. The GEOID18 model was used.

The adjustment constrained the CORS positions (as computed and broadcast by the network) in all three dimensions (NAD83 (2011) latitude, longitude, and ellipsoidal height). The estimated variance factor for adjustment was 0.43. This adjustment provided the adjusted positions (NAD83 (2011) epoch 2010.0) and GPS derived orthometric heights (NAVD88) for the stations in the network. The adjusted latitude/longitudes were transformed to UTM Zone 18 grid coordinates. Figure 3 shows the GNSS horizontal and vertical residuals for this adjustment (in meters).

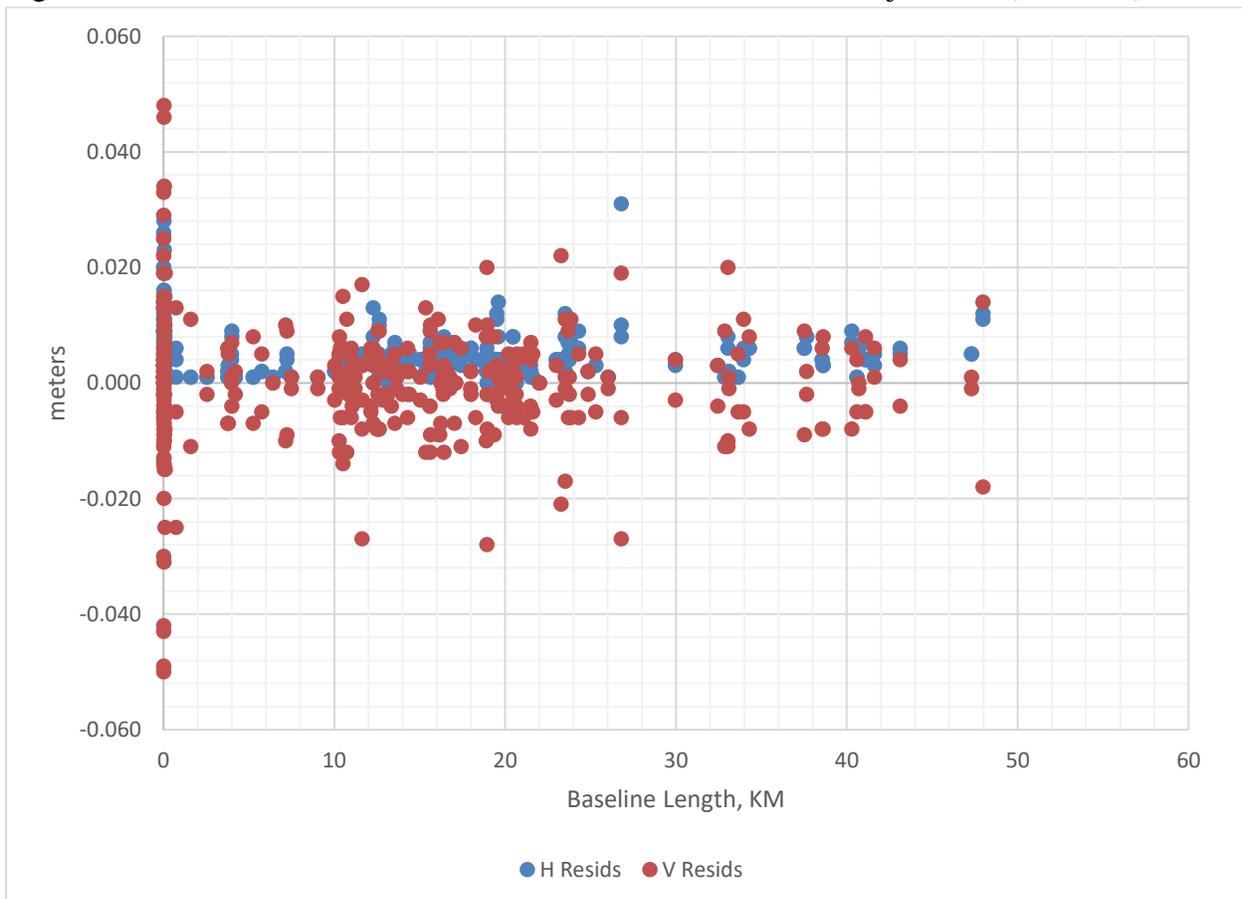

Figure 3 - Constrained Adjustment Residuals (meters)

Table 5 lists the station confidence regions at the 95% level, in meters.
