# 1 Data Acquisition and Processing

## 1.1 Introduction

Digital Aerial Solutions, LLC (DAS) was tasked with planning, acquiring, processing, and deriving elevation products for Light Detection and Ranging (LiDAR) for the **140G0222F0224-MO\_SouthernMO\_D22**. This task order requests a Fall/Winter leaf-off 2022 lidar survey to be collected over approximately 1,025 square miles in Southern Missouri. LiDAR survey to be collected at an aggregate nominal pulse spacing (ANPS) < 0.71 meters (QL2) including overlap, with up to 2 discrete returns per pulse along with intensity values of each return. Aerial LiDAR was collected over approximately 1,025 square miles of Christian, New Madrid, Pemiscot, Stoddard, Wayne, and Wright counties in the state of Missouri using the Leica Terrain Mapper as shown in Figure 1's Defined Project Area (DPA) for delivery.

LiDAR dataset were post processed to generate elevation point cloud swaths for each flight lines. Deliverables include tiled point cloud classified by land cover type, breaklines to support hydro-flattening of digital elevations models (DEM), intensity image and bare-earth DEM. Swath separation raster and Maximum Surface Height Raster (MSHR) are also delivered as ancillary data.

The point cloud deliverables are stored in the LAS Version 1.4-point data record format 6. The tiling scheme for the tiled deliverables is a **1,500 x 1,500 meters** grid. Tile naming convention is based on the US National Grid (USNG) format. All deliverables were generated in compliance with the U.S Geological Survey National Geospatial Program Guidelines and Base Specifications, Version 2022 Revision A. The spatial reference of the data is as follows;

### **Horizontal Spatial Reference**

- Coordinates: UTM, Zone 15 & 16 North Meters (to 2 decimal places)
- Datum: North American Datum 1983 (2011), Meters (to 2 decimal places)

### **Vertical Spatial Reference**

All datasets are available with orthometric elevation; point cloud datasets are also available with ellipsoid heights.

- Datum: North American Vertical Datum of 1988 (GEOID18)

## 1.2 Mission Acquisition

Mission acquisition for **140G0221D0017 MO\_SouthernMO\_D22** survey was done using Monett Regional Airport (KHFJ), West Plains Regional Airport (KUNO), and Poplar Bluff Municipal Airport (KPOF) as base airports. A Leica Terrain Mapper (TM) was used for data collection. Ground GPS base stations were established to collect data at half (0.5) second epoch in support of all airborne acquisitions. All acquisition was completed in 6 missions between March 15, 2023 – March 20, 2023. There was a total of 118 planned flightlines covering the entire Delivery Block, approximately 1,025 square miles of Christian, New Madrid, Pemiscot, Stoddard, Wayne, and Wright counties in the state of Missouri. All mission flight logs and GPS Session forms can be found in Appendix A and B.

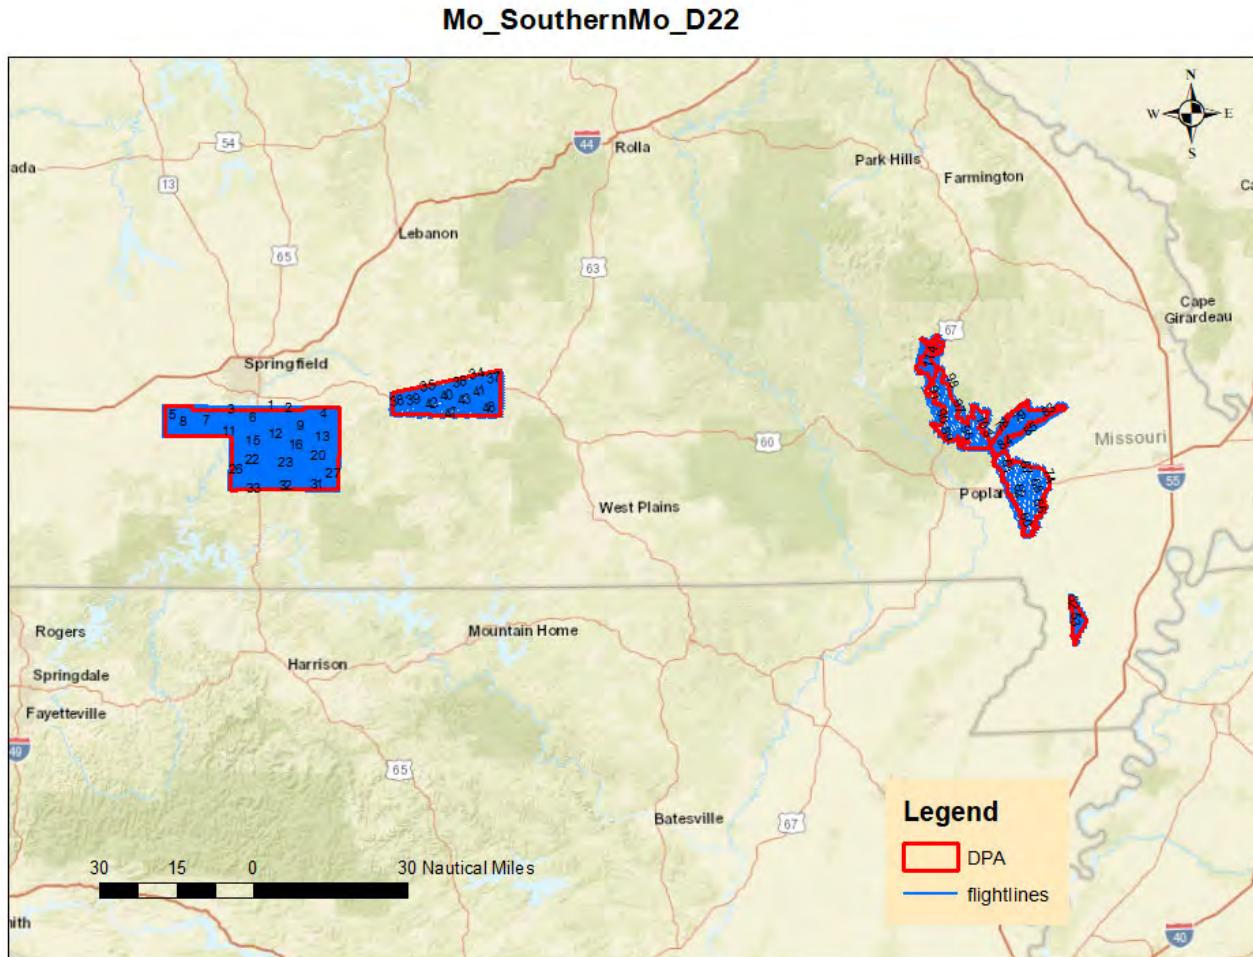

Figure 5 MO\_SOUTHERNMO\_D22 Flightlines

### 1.3 Acquisition Parameters

Acquisition parameters are designed to meet the project task order requirements. The sensor configuration and the flight plan characteristics are selected based on a number of project specific criteria. These include data accuracy, land cover types within the project area and the required nominal pulse spacing. Aggregate Nominal Pulse Density (ANPD) for QL2 is no less than 2ppm. Table 1 summarizes the planned project parameters for **MO\_SouthernMO\_D22**.

IMU Misalignment estimation was performed for the Terrain Mapper sensor to correct angular offset in roll, pitch and heading between IMU measurement frame and mapping sensor measurement frame. Flight line design for measurement estimation includes, double cross lines at 200 meters, AGL (4 total strips) flown twice in opposite directions. The misalignment estimation steps include; Trajectory processing (smooth best estimate of trajectory) in Inertial Explorer software, followed by misalignment estimation in HxMap (Leica Proprietary) software for roll, pitch and heading. Quality control report is created and analyzed to ensure the new calibration parameters computed is accurate to implement into LiDAR workflow.

Parameter (QL2)	Terrain Mapper (SN90524)
Flying Height Above Ground Level:	6500 feet
Nominal Sidelap:	30 %
Nominal Speed Over Ground:	155 Knots
Field of View:	40°
Laser Rate:	650.00 kHz
Scan Rate:	150.00 Hz
Average Point Spacing:	0.440 meters

*Table 1 Flight Parameters*

## 1.4 Mission Conditions

The acquisition mission for **140G0221D0017 MO\_SouthernMO\_D22** survey was conducted under optimal collection conditions.

# 2 ABGNSS-inertial Processing

## 2.1 Airborne GPS/IMU

Aircraft	Sensor	GPS Lever Arm (m)	IMU Lever Arm (m)
C441_N207SS	TM_90524	X: -0.043, Y: -0.169, Z: -1.083	X: 0.124, Y: -0.025, Z: 0.014

*Table 2 Aircraft and Lever Arms*

GPS Base Station Coordinates: North American Datum 1983 (2011), Vertical Ellipsoid, Meters

Name	Latitude (N)	Longitude (W)	Ellipsoid (m)
Monett Regional Airport -KHFJ	36°54' 39.63924"	94° 0' 40.03160"	369.484
West Plains Municipal Airport -KUNO	36°52' 39.79024"	91° 54' 15.00538"	341.858
Poplar Bluff Municipal Airport-KPOF	36°45' 58.58305"	90° 19' 25.08150"	69.161

*Table 3 Base station Locations*

## 2.2 SMOOTH BEST ESTIMATE OF TRAJECTORY (SBET)

Inertial Explorer 8.90 software was used to compute inertial solution file (\*.sol) for each mission using ground GPS base station (KHFL, KUNO & KPOF) and OPUS position coordinate in table 3 above. The resulting solution was checked to ensure a minimum accuracy of +/- 0.10m, combined separation, for horizontal and vertical positions respectively. Inertial Explorer methodology integrates Inertial Navigation Solution by processing the GPS data and Inertial Measurement Unit (IMU). The software applies the reference lever arms for the GPS and IMU, in table 2, during the process to determine the trajectory (position and orientation) of the LiDAR sensor during the acquisition mission. Inertial Explorer generated graphical results were reviewed to ensure that the IMU data was healthy. Graphical results for all lifts can be found in Appendix D.

## 2.3 Point Cloud Creation

Raw LiDAR sensor ranging data and the final solution sensor trajectory (\*.sol), from Inertial Explorer, were processed in Leica's HxMap software to produce LiDAR point cloud swath for each flight line in LAS version 1.4 file format. Quality control of the swath point cloud was performed to validate proper functioning of the sensor system, full coverage of the project area and point density of the LiDAR data. Swath point clouds were assigned unique file source identification. The data was found to be complete and consistent with the sensor calibration parameters.

Point Cloud statistics analyses to determine Nominal Point Spacing (NPS) and Point Density for the MO\_SouthernMO\_D22 dataset was performed using LP360 (Advanced 64-bit) v2021.1.47.0 software. A total of ninety-three (93) sample point cloud tiles, carefully selected and well distributed in the defined project area (DPA) were used to determine the average point cloud statistics for the project. LP360 "Point Cloud Statistics Extractor" point cloud task (module) enables a summary statistic for a point cloud to be exported for all active dataset loaded into the software.

The procedure involved;

- 1) Adding all selected Point Cloud data into the software
- 2) Open the point cloud task command

- 3) Select the “Point Cloud Statistics Extractor” task
- 4) Define the point cloud statistics to report for each active point cloud
- 5) Apply and execute command to export an ASCII text report.

For the MO\_SouthernMO\_D22 point cloud, the computed average NPS is 0.440 (target <=0.71) and the average point density is 6.105 (target >=2ppm). Detailed summary report is shown in the table below.

Number of Sample Tiles	Average Point Density	Average Point Density Class 1	Average Point Density Class 2	Average NPS
76	6.105	3.823	2.267	0.440

Tile	Total Point Count	Point Count Class_1	Point Count Class_2	Point Density	Point Density Class_1	Point Density Class_2	NPS

## 2.4 Geometric Calibration

LiDAR data calibration was done using Leica HxMap v3.6.0 software. HxMap is the common workflow platform for Leica airborne sensors. The processing workflow involves; Ingest, Block Creation, LiDAR Matching, Quality Assurance (QA) and Product Generation. LiDAR is processed in HxMap by generating point clouds from raw sensor data during the Ingest step. Noise filtering, sensor installation calibration and atmospheric condition parameters are also applied during the ingest process. Once all data is processed through ingest, they are assembled into a block for LiDAR Matching. The LiDAR Matching step resolves LiDAR registration errors which remain in the point clouds after sensor and installation calibration parameters are applied in the ingest step.

After LiDAR Matching is complete, QA tool is run on the Block to verify quality of results. QA Tool measurements are 2D patches with vertical statistics computed, therefore patches are only found on open terrain with moderate slope. Patches are not expected in areas of forest or crop, or on mountainous slopes. The QA results are reviewed to ensure that, 95% of patches<5cm for Vertical Scan Direction and Vertical Line Separation. Ground control points are also included to assess absolute accuracy for the point cloud data. HxMap's detailed QA results can be found in Appendix E.

LiDAR products are finally generated in the Product Generation step as LAS swaths (LAS 1.4). Vertical (Z) shift (calculated from QA step) is also applied during the product generation. The exported LAS 1.4 swath data from HxMap is imported into GeoCue Group's product workflow management software, GeoCue v2017. The full point cloud is tiled into a manageable size for processing in TerraScan. The final geometrically calibrated swath point cloud was compared to the bare-earth profile survey data. The data fit the profile surveys within the vertical accuracy tolerance specified for the project. Full documentation of the vertical accuracy checks maybe found in section 3.2 For **140G0222F0224 MO\_SouthernMO\_D22** QL2 LiDAR project, the control points listed below were used in data adjustment.

Point Id	Easting	Northing	Ortho_Height

Table 5 Ground Control Points

## 3. Geometric Quality

### 3.1 Point Cloud

This refers to the internal geometric quality of the lidar dataset without regard to surveyed ground control. Two primary factors are considered in the lidar data vertical accuracy; Intraswath Precision (Smooth Surface Precision) & Interswath (Overlap) consistency, along with absolute accuracy assessments against project ground control.

**Swath Separation Images (SSI)** depicts interswath accuracy using color coding to illustrate differences in elevation (z) values where swaths overlap. The semi-coded images are semi-transparent and overlay the lidar intensity image. The SSI are ancillary metadata used as visual aids to identify regions more easily within point cloud dataset that may have suspect interswath alignment or other geometric issues. For this project, the SSI creation involved using; all returns lidar point cloud, excluding noise classes (7 & 18). The images are derived from TINs and consist of 50 percent transparent RGB layer overlaying the lidar intensity images. The image uses three color levels (0-8cm: GREEN, 8-16cm: YELLOW, >16cm: RED) within a pixel, where two or more swaths overlap. The SSI are shown in figures below and are also delivered as GeoTIFF images at cell size equal to 2.5m.

**Intraswath Precision (Smooth Surface Precision):** Digital Aerial Solutions utilizes a Terrain Mapper LiDAR sensor that is calibrated to meet the relative vertical accuracy standards listed in the Lidar base specification. Smooth Surface Precision results was generated using Leica HxMap software v4.20, in accordance the criteria listed below for determining Intraswath precision, over a calibration site at Lakeland Regional Airport, in Florida. The result is shown in Appendix E.

*Precision = Range - (Slope x CellSize x 1.414)* where:

*Precision, Range, and Slope* are rasters (square cells assumed);

- *Range* is the difference between the highest and lowest lidar points in each pixel;
- *Slope* is the maximum slope of the cell to its 8 neighbors, expressed as a decimal value, calculated from the minimum elevation in each cell; and
- *CellSize* is the edge dimension of the cell. 1.414 is the factor to compute the diagonal dimension of the pixel.
- *CellSize* is set to the ANPS, rounded up to the next integer, and then doubled:
- $CellSize = CEILING(ANPS) \times 2$
- where:
  - *CEILING* is a function to round *ANPS* up to the next integer
  -
- Assessment of precision will be made on hard surfaced areas (for example, parking lots or large rooftops) containing only single return lidar points.
- Sample areas for assessment of precision will be approximately 100 pixels.
- To the degree allowed by the data and the project environment, multiple sample areas representing the full width of the swath(s) (left, center, and right) will be examined.
- Multiple single swaths from a single lift may be used if needed to sample the full swath width.
- At a minimum, precision shall be assessed against for each lift of each aircraft/instrument combination used on the project. Additional areas may be checked at the discretion of the USGS–NGP.
- Each test area will be evaluated using a signed difference raster with a cell size equal to the ANPS, rounded up to the next integer, then doubled ( $CellSize=CEILING(ANPS)\times 2$ ).

- The difference rasters will be statistically summarized to verify that root mean square difference in the z - direction ( $\text{RMSD}_z$ ) values do not exceed the limits set forth in [table 2](#) for the QL of information that is being collected.
- Precision shall be reported by way of a polygon shapefile delineating the sample areas checked and, using the cells within each polygon as sample values, attributed with:
  - minimum slope-corrected range (numeric),
  - maximum slope-corrected range (numeric), and
  - $\text{RMSD}_z$  of the slope-corrected range (numeric)

*Figure 5 Swath Separation Image*

## 3.2 Accuracy Assessment

This data set was produced to meet **ASPRS “Positional Accuracy Standards for Digital Geospatial Data” (2014)** for a 36.0 (cm) RMSE<sub>x</sub> / RMSE<sub>y</sub> Horizontal Accuracy Class which equates to Positional Horizontal Accuracy =+/- 71.0 cm at a 95%

The absolute vertical accuracy of the point cloud data is assessed against ground check point data. For the **140G0222F0224 MO\_SouthernMO\_D22** project, ground check point data were surveyed using RTK- GPS techniques.

Local TIN models of the elevation points are built around each ground check points. The tin model elevation is sampled at the horizontal position of the ground check point. The TIN model elevation and ground check point survey elevation values were used to calculate the Non-vegetated Vertical Accuracy (NVA) of the swath point clouds. Calculations were produced to meet ASPRS “Positional Accuracy Standards for Digital Geospatial Data” (2014).

The tiled point cloud products were reviewed for full coverage of the AOI and proper classification. As part of the QC process, TINs are built in the Terramodeler software for each tile using the ground class and the hydro-flattening breaklines. The TINs are reviewed for non-ground features, and edited where necessary to remove any remaining non-ground features. Points were also reviewed for absolute elevation, and points falling below the selected orthometric elevation for water were removed from the ground class.

Tested Accuracy	RMSE <sub>Z</sub>	NVA	VVA
Classified LiDAR	0.038	65	53
Digital Elevation Model	0.038	65	53

*Table 6 Tested RMSE<sub>Z</sub> of NVA and VVA of LiDAR Point Cloud and Digital Elevation Model*

Total #	# NVA	# VVA
116	65	53

*Table 7 Number of Survey Points used to calculate accuracy of data.*

## 4. Production

### 4.1 Point Cloud Classification

Georeferenced information was applied to the swath point cloud LAS files. Geometrically calibrated swath point cloud was cut into **1,500-meter x 1,500-meter** LAS 1.4 format tiles for point cloud classification. Tiled point cloud data was processed in Terrasolid's TerraScan software to assign initial classification values. The TerraScan software provides a number of automated routines to algorithmically detect and assign points to their appropriate classes. Points left

unclassified by the algorithmic routine remain as Class 1– Processed, but unclassified. Automated classification routines assigned points to one of the following classes:

**Class 1- Processed, but unclassified**

**Class 2- Bare-earth ground**

**Class 7- Low Noise (low, manually identified, if necessary)**

**Class 9- Water**

**Class 17- Bridge Decks**

**Class 18- High Noise (high, manually identified, if necessary)**

**Class 20- Ignored Ground (Breakline Proximity)**

Automated classification results were reviewed for each tiled point cloud, and manual edits were made where necessary to correct for misclassified points.

## 4.2 Breakline Collection

Hydrographic breakline features were compiled in ArcGIS Desktop v10.7.0, using LiDAR intensity ortho and surface terrain model of the entire project area. The 2D features were checked to ensure they had no geometric or topological errors. Three-dimensional (3D) breakline conflation was done using a fully automated elevation conflation method in GeoCue LP360 v.2021.1.47.0 software. QA/QC procedure was done in ArcGIS Desktop using python scripts to check for monotonicity and vertical variance, to ensure that the 3D breakline features met 3DEP requirements.

## 4.3 DEM Generation

Bare earth Digital Elevation Model (DEM) was created using LP360 v.2021.1.47.0 software. Input data for DEM creation include classified LAS point cloud (bare earth, class2), 3D hydrographic breaklines, and project tile index. The breakline features were used to classify water (class 9) and ignored ground (class 20) in the point cloud. These points (classes 9 & 20) are excluded in the DEM generation. Raster (DEM) production methodology include, hydro breakline enforcement and bilinear interpolation resample. Final DEM are exported in GEOTIFF format and tiled to USNG tile extent. GDAL V2.4.2 was used to write final header information for all DEM products.

## Appendix C. Vertical Accuracy Calculations

---

## Project Information

Prepared By: RY

Project Name: Mo\_SouthernMo\_D22

Sensor Info: TM

Required Nominal Pulse Spacing: 0.71

Vendor Name: Digital Aerial Solutions, LLC

Units: Meters

Percent of Extent Tolerance: Extents Not Checked

Date of Acquisition: Start: 3/15/2023 Finish: 3/20/2023

---

## Metadata Information

### Tile Index:

Filename: MO\_SouthernMO\_D22\_DPA\_MTI\_UTM15.shp

Number of Polys: 0

### Intensity:

Tile Index Attribute: Not Specified

Data Filename: Not Specified

Number of Data Files Matching Attribute: Not Specified

### DEM:

Tile Index Attribute: Name

Data Filename: UTM15N

Number of Data Files Matching Attribute: 36 out of 1385

### LAS:

Tile Index Attribute: Name

Data Filename: UTM15N

Number of Data Files Matching Attribute: 36 out of 1385

# Tiled-Data Area

## LiDAR Accuracy Assessment Summary

LC Type	# Points	NVA	VVA	RMSE Z
LAS		95% Confidence	95 Percentile	
Bare Earth	32	0.083		0.042
High Vegetation	20		0.143	0.230
Low Vegetation	17		0.091	0.066
Medium Vegetation	12		0.055	0.038

## Project Information

Prepared By: R.Y

Project Name: Mo\_SouthernMo\_D22

Sensor Info: TM

Required Nominal Pulse Spacing: 0.71

Vendor Name: Digital Aerial Solutions, LLC

Units: Meters

Percent of Extent Tolerance: Extents Not Checked

Date of Acquisition: Start: 3/15/2023 Finish: 4/19/2023

---

## Metadata Information

### Tile Index:

Filename: MO\_SouthernMO\_D22\_DPA\_MTI\_UTM16N.shp

Number of Polys: 0

### Intensity:

Tile Index Attribute: Not Specified

Data Filename: Not Specified

Number of Data Files Matching Attribute: Not Specified

### DEM:

Tile Index Attribute: Name

Data Filename: UTM16N

Number of Data Files Matching Attribute: 40 out of 40

### LAS:

Tile Index Attribute: Name

Data Filename: UTM16N

Number of Data Files Matching Attribute: 40 out of 40
