# 1. Introduction

## 1.1 Project Summary:

Aero-Graphics Inc. is under contract to Dewberry Engineers to provide surveyed ground check points to support the acquisition of aerial lidar for 4,470 sq. miles in eastern Montana. The survey field work was conducted August 20, 2021, thru October 4, 2021. The check point locations were well distributed across the project areas as evenly as the terrain would allow.

As a verification of field procedures, 50% of the check points surveyed were re-observed with the results shown in section 5 of this report.

The final horizontal coordinates are referenced to NAD83(2011) Montana Stat Plane meters. The final vertical elevations are referenced to NAVD88 meters using Geoid model 2018 (Geoid18).

## 1.2 Surveyor:

Questions regarding this report can be addressed to:

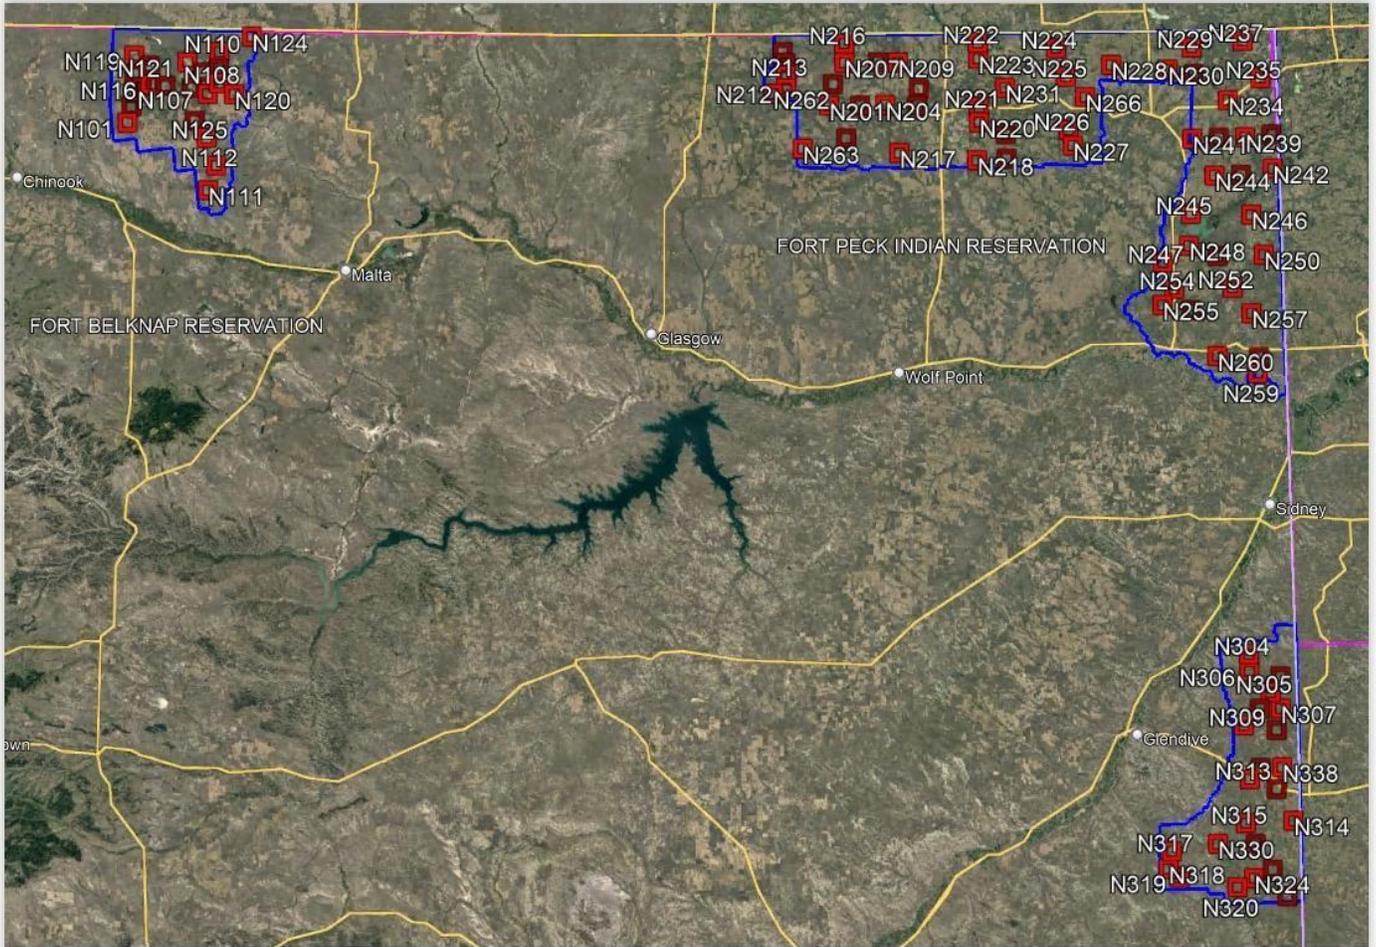

Karl Jensen, PLS, CP  
Surveying Manager  
Aero-Graphics, Inc  
40 W Oakland Ave  
Salt Lake City, Utah 84115  
801-487-3273  
801-891-2779 direct

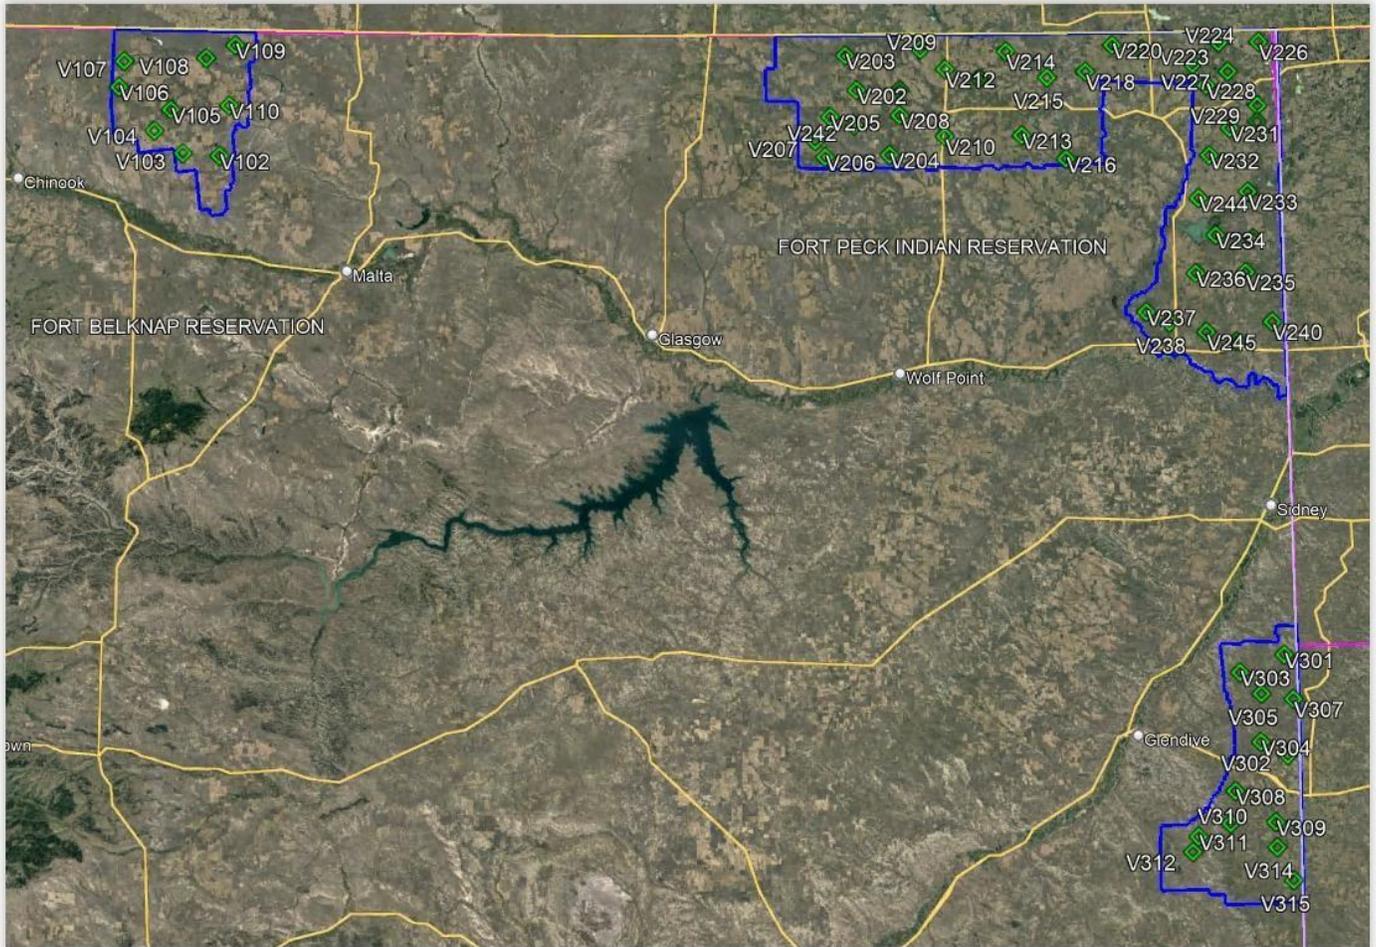

Utah Licensed Professional Land Surveyor #7643406, exp date 3/31/2023  
Colorado Licensed Professional Land Surveyor #PLS-0038527, exp date 10/31/2023  
ASPRS Certified Photogrammetrist, exp date 9/17/2023

### 1.3 Project Areas:

#### NVA Points

## VVA Points

## **2. Project Details**

### **2.1 Survey Equipment**

The equipment listed below was used to survey the ground points for this LiDAR project.

TOPCON Dual Frequency/ Dual Constellation GNSS Receivers:

HiPER Ga, S/N: 498-00418	HiPER Ga, S/N: 457-02513
HiPER SR, S/N: 1064-16270	HiPER SR, S/N: 1209-11478
HiPER SR, S/N: 1209-10832	HiPER SR, S/N: 1209-14758
HiPER SR, S/N: 1209-18284	HiPER SR, S/N: 1209-18273

Spectra Precision Ranger 3 Data Collector

Two meter fixed height range pole for each Topcon GNSS HiPER receiver with attached bipod legs for stability.

### **2.2 Surveyed Point Details**

The check points were well distributed throughout the project areas. Five (5) photographs were taken of each point, looking north, east, south, west, and close on the point\ nail. A paint mark, mag nail, or spike was set at each location where possible. Some points were surveyed at photo\lidar identifiable locations.

Check point locations are detailed in the “Check Point Documentation Report” sheets attached to this report.

### **2.3 Surveyed Point Network**

Static GNSS survey methods were used during the field survey to observe the check points. The process for this method is detailed below.

LiDAR identifiable features were observed as NVA check points where available.

## **STATIC:**

Static (or Rapid-Static) Surveying is a method that Aero-Graphics has employed for many years to collect ground check points. A base station location is selected, usually at one or more control locations, and a GNSS receiver is left there for the duration of the day to complete the survey. The other GNSS receivers are then used as rovers to survey the other point locations.

The duration of the rover receivers will vary depending upon the distance from the base receiver. Normally the rover will not be further than 10 km from the base. The greater the distance the rover is from the base receiver, the longer the recording duration of the rover needs to be. Each rover location is surveyed for a minimum of 20 minutes or greater.

Static Surveying was used to collect the check points.

The individual point locations are post-processed after the field survey is completed. The GNSS data collected by the receivers is downloaded and processed in NovaTel's Waypoint GravNET software. The base station coordinates are used to differentially correct the other point's locations.

The NGS Online Positioning User Service (OPUS) was used to process the base station location data. A minimum of 2+ hours of GNSS data was collected for base stations to be processed through OPUS.

## **2.4 Field Procedures and Analysis**

All check points were observed once and 50% of the locations were surveyed a second time on a different day. Each observation for static surveying occupied the point for a minimum of 20 minutes in duration.

## **2.5 Data Processing Procedures**

The data from the static GNSS receivers was downloaded each day and a copy was uploaded to the office FTP server.

Base station observations were uploaded to OPUS only after the rapid ephemeris was available for processing. Whether the base station was located on an NGS monument or at a new point location, all GNSS data sets with a duration longer than two (2) hours were processed through OPUS.

The static surveyed points were post-processed using NovaTel's Waypoint software. Some of the static check point observations of less than two (2) hours in duration were processed with OPUS Rapid Static (OPUS-RS) as a QA\QC on the static post processing.

## **6. Deliverables**

Along with this report, the deliverables to Dewberry Engineers include the Check Point Documentation Report sheets and an Excel Spreadsheet including all check point data.
