1. Summary / Scope

1.1. Summary

This report contains a summary of the 36170_MT_Phase2_2020_B20, Work Unit 230589 lidar acquisition task order, issued by USGS under their Contract G16PC0016 on 08/12/2020. The task order yielded a project area covering 2,927 square miles over Montana at Quality Level 2. The intent of this document is only to provide specific validation information for the data acquisition/collection, processing, and production of deliverables completed as specified in the task order.

1.2. Scope

Aerial topographic lidar was acquired using state of the art technology along with the necessary surveyed ground control points (GCPs) and airborne GPS and inertial navigation systems. The aerial data collection was designed with the following specifications listed in Table 1 below.

Table 1. Originally Planned Lidar Specifications

Average Point Density	Flight Altitude (AGL)	Field of View	Minimum Side Overlap	RMSEz
2 pts / m2	2500 m	58.5°	20%	≤ 10 cm

1.3. Coverage

The project boundary covers 2,927 square miles over Montana. Project extents are shown in Figure 1.

1.4. Duration

Lidar data was acquired from August 12, 2020 and September 8, 2020 in 16 total lifts. See “Section: 2.4. Time Period” for more details.

1.5. Issues

Some tiles in the area of interest had snow on the surface. These were classified as 21 under the LAS classifications.

36170_MT_Phase2_2020_B20 Work Unit 230589 Projected Coordinate System: NAD_1983_2011_StatePlane_Montana_FIPS_2500 Horizontal Datum: NAVD83 (2011) Vertical Datum: NAVD88 (GEOID 18) Units: Meters

2. Planning / Equipment

2.1. Flight Planning

Flight planning was based on the unique project requirements and characteristics of the project site. The basis of planning included: required accuracies, type of development, amount / type of vegetation within project area, required data posting, and potential altitude restrictions for flights in project vicinity.

Detailed project flight planning calculations were performed for the project using RiPARAMETER planning software.

2.2. Lidar Sensor

NV5 Geospatial utilized Riegl VQ1560i and VQ1560ii lidar sensors (Figure 2), serial number(s) 4040 for data acquisition.

The Riegl 1560II system is a dual channel waveform processing airborne scanning system. It has a laser pulse repetition rate of up to 4 MHz resulting in up to 2.66 million measurements per second. The system utilizes a Multi-Pulse in the Air option (MPIA) and an integrated IMU/GNSS unit.

A brief summary of the aerial acquisition parameters for the project are shown in the lidar System Specifications in Table 2.

Table 2. Lidar System Specifications

		Riegl VQ1560ii (4040)
Terrain and Aircraft Scanner	Flying Height	2,305 m
	Recommended Ground Speed	145 kts
Scanner	Field of View	60°
	Scan Rate Setting Used	81 lps
Laser	Laser Pulse Rate Used	350 kHz
	Multi Pulse in Air Mode	yes
Coverage	Full Swath Width	2,583 m
	Line Spacing	2,066 m
Point Spacing and Density	Average Point Spacing	0.64 m
	Average Point Density	2.45 pts / m^2

Figure 2. Riegl VQ1560ii Lidar Sensor

2.3. Aircraft

All flights for the project were accomplished through the use of customized planes. Plane type and tail numbers are listed below.

Lidar Collection Planes

- Piper Navajo (twin-piston), Tail Number(s): N6GR
- Cessna Caravan (single-turboprop), Tail Number(s): N840JA
- 1977 Piper PA-31-325 (fixed wing multi engine), Tail Number(s): N22GE

These aircraft provided an ideal, stable aerial base for lidar acquisition. These aerial platforms have relatively fast cruise speeds, which are beneficial for project mobilization / demobilization while maintaining relatively slow stall speeds, proving ideal for collection of high-density, consistent data posting using a state-of-the-art Riegl VQ1560ii lidar systems. Some of NV5 Geospatial's operating aircraft can be seen in Figure 3 below.

Figure 3. Some of NV5 Geospatial's Planes

2.4. Time Period

Project speci ic lights were conducted between August 12, 2020 and September 8, 2020. Sixteen aircra t li ts were completed. Accomplished li ts are listed below.

Lift	Start UTC	End UTC
08122020A (SN4040,N22GE)	8/12/2020 2:02:33 PM	8/12/2020 4:33:40 PM

3. Processing Summary

3.1. Flight Logs

Flight logs were completed by Lidar sensor technicians for each mission during acquisition. These logs depict a variety of information, including:

- Job / Project #
- Flight Date / Lift Number
- FOV (Field of View)
- Scan Rate (HZ)
- Pulse Rate Frequency (Hz)
- Ground Speed
- Altitude
- Base Station
- PDOP avoidance times
- Flight Line #
- Flight Line Start and Stop Times
- Flight Line Altitude (AMSL)
- Heading
- Speed
- Returns
- Crab

Notes: (Visibility, winds, ride, weather, temperature, dew point, pressure, etc). Project specific flight logs for each sortie are available in Appendix A.

3.2. Lidar Processing

Applanix + POSPac software was used for post-processing of airborne GPS and inertial data (IMU), which is critical to the positioning and orientation of the lidar sensor during all flights. Applanix POSPac combines aircraft raw trajectory data with stationary GPS base station data yielding a “Smoothed Best Estimate Trajectory” (SBET) necessary for additional post processing software to develop the resulting geo-referenced point cloud from the lidar missions.

During the sensor trajectory processing (combining GPS & IMU datasets) certain statistical graphs and tables are generated within the Applanix POSPac processing environment which are commonly used as indicators of processing stability and accuracy. This data for analysis include: max horizontal / vertical GPS variance, separation plot, altitude plot, PDOP plot, base station baseline length, processing mode, number of satellite vehicles, and mission trajectory.

Point clouds were created using the RiPROCESS software. The generated point cloud is the mathematical three dimensional composite of all returns from all laser pulses as determined from the aerial mission. The point cloud is imported into GeoCue distributive processing software. Imported data is tiled and then calibrated using TerraMatch and proprietary software. Using TerraScan, the vertical accuracy of the surveyed ground control is tested and any bias is removed from the data. TerraScan and TerraModeler software packages are then used for automated data classification and manual cleanup. The data are manually reviewed and any remaining artifacts removed using functionality provided by TerraScan and TerraModeler.

DEMs and Intensity Images are then generated using proprietary software. In the bare earth surface model, above-ground features are excluded from the data set. Global Mapper is used as a final check of the bare earth dataset.

Finally, proprietary software is used to perform statistical analysis of the LAS files.

Software	Version
Applanix + POSPac	8.6
RiPROCESS	1.8.6
GeoCue	2020.1.22.1
Global Mapper	19.1;20.1
TerraModeler	21.008
TerraScan	21.016
TerraMatch	21.007

3.3. LAS Classification Scheme

The classification classes are determined by Lidar Base Specifications 2.1 and are an industry standard for the classification of lidar point clouds. All data starts the process as Class 1 (Unclassified), and then through automated classification routines, the classifications are determined using TerraScan macro processing.

The classes used in the dataset are as follows and have the following descriptions:

Table 3. LAS Classifications

	Classification Name	Description
1	Processed, but Unclassified	Laser returns that are not included in the ground class, or any other project classification
2	Bare earth	Laser returns that are determined to be ground using automated and manual cleaning algorithms
7	Low Noise	Laser returns that are often associated with scattering from reflective surfaces, or artificial points below the ground surface
9	Water	Laser returns that are found inside of hydro features
17	Bridge Deck	Laser returns falling on bridge decks
18	High Noise	Laser returns that are often associated with birds or artificial points above the ground surface
20	Ignored Ground	Ground points that fall within the given threshold of a collected hydro feature.
21	Snow	Ground points that fall on snow, where identifiable

3.4. Classified LAS Processing

The bare earth surface is then manually reviewed to ensure correct classification on the Class 2 (Ground) points. After the bare- earth surface is finalized; it is then used to generate all hydro-breaklines through heads-up digitization.

All ground (ASPRS Class 2) lidar data inside of the Lake Pond and Double Line Drain hydro flattening breaklines were then classified to water (ASPRS Class 9) using proprietary tools. A buffer of 3 feet/1 meter was also used around each hydro flattened feature to classify these ground (ASPRS Class 2) points to Ignored ground (ASPRS Class 20). All Lake Pond Island and Double Line Drain Island features were checked to ensure that the ground (ASPRS Class 2) points were reclassified to the correct classification after the automated classification was completed.

Any noise that was identified either through manual review or automated routines was classified to the appropriate class (ASPRS Class 7 and/or ASPRS Class 18) followed by flagging with the withheld bit.

All data was manually reviewed and any remaining artifacts removed using functionality provided by TerraScan and TerraModeler. Global Mapper is used as a final check of the bare earth dataset. GeoCue was then used to create the deliverable industry-standard LAS files for all point cloud data. NV5 Geospatial's proprietary software was used to perform final statistical analysis of the classes in the LAS files, on a per tile level to verify final classification metrics and full LAS header information.

3.5. Hydro-Flattened Breakline Processing

Class 2 lidar was used to create a bare earth surface model. The surface model was then used to heads-up digitize 2D breaklines of Inland Streams and Rivers with a 100 foot nominal width and Inland Ponds and Lakes of 2 acres or greater surface area.

Elevation values were assigned to all Inland streams and rivers using NV5 Geospatial's proprietary software.

All ground (ASPRS Class 2) lidar data inside of the collected inland breaklines were then classified to water (ASPRS Class 9) using TerraScan macro functionality. A buffer of 3 feet was also used around each hydro-flattened feature. These points were moved from ground (ASPRS Class 2) to Ignored Ground (ASPRS Class 20).

The breakline files were then translated to Esri file geodatabase format using Esri conversion tools.

Breaklines are reviewed against lidar intensity imagery to verify completeness of capture. All breaklines are then compared to TINs (triangular irregular networks) created from ground only points prior to water classification. The horizontal placement of breaklines is compared to terrain features and the breakline elevations are compared to lidar elevations to ensure all breaklines match the lidar within acceptable tolerances. Some deviation is expected between breakline and lidar elevations due to monotonicity, connectivity, and flattening rules that are enforced on the breaklines. Once completeness, horizontal placement, and vertical variance is reviewed, all breaklines are reviewed for topological consistency and data

integrity using a combination of Esri Data Reviewer tools and proprietary tools.

3.6. Hydro-Flattened Raster DEM Processing

Class 2 lidar in conjunction with the hydro breaklines were used to create a 1-meter Raster DEM. Using automated scripting routines within proprietary software, a GeoTIFF file was created for each tile. Each surface is reviewed using Global Mapper to check for any surface anomalies or incorrect elevations found within the surface.

3.7. Intensity Image Processing

GeoCue software was used to create the deliverable intensity images. All withheld points were ignored during this process. This helps to ensure a more aesthetically pleasing image. The GeoCue software was then used to verify full project coverage as well. GeoTIFF files with a cell size of 1-meter were then provided as the deliverable for this dataset requirement.

3.8. Height Separation Raster Processing

Swath Separation Images are rasters that represent the interswath alignment between flight lines and provide a qualitative evaluation of the positional quality of the point cloud. Proprietary software was used to create 1-meter raster images in GeoTIFF format.

36170_MT_Phase2_2020_B20
Work Unit 230589 Tile Layout

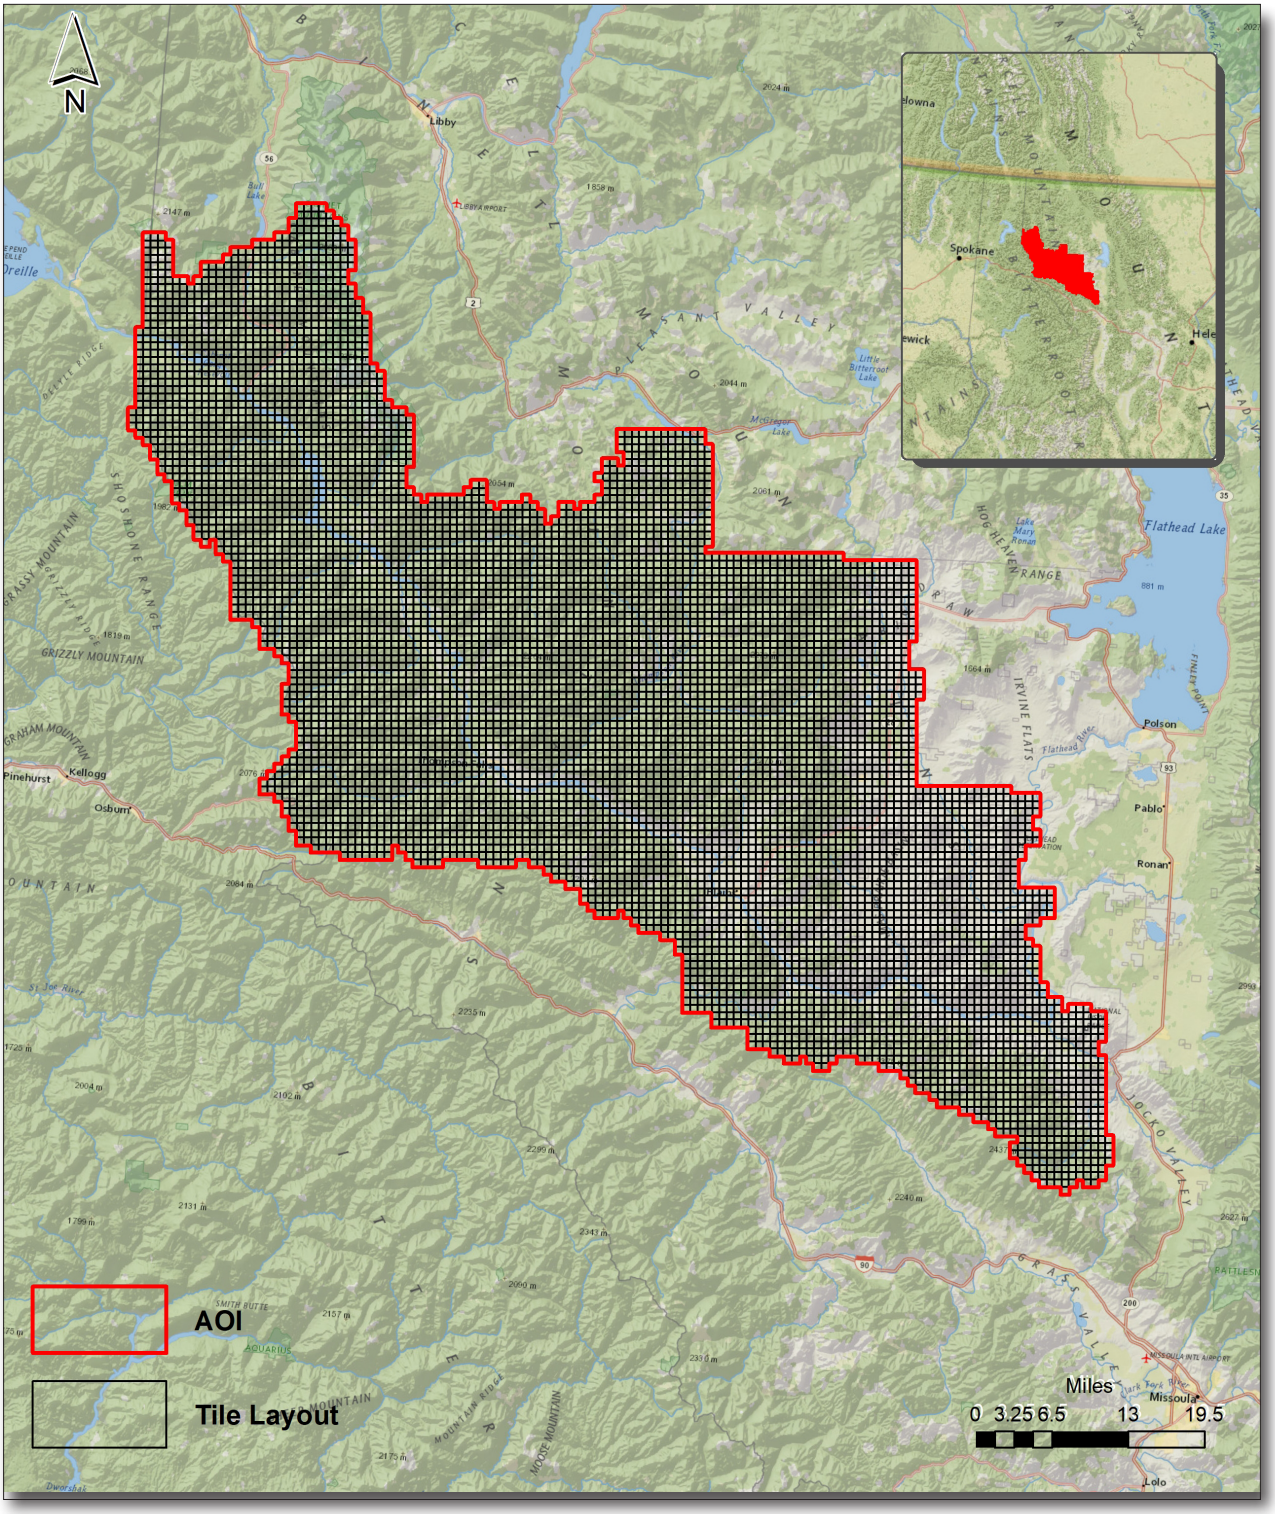

Figure 4. Lidar Tile Layout

4. Project Coverage Verification

Coverage verification was performed by comparing coverage of processed .LAS files captured during project collection to generate project shape files depicting boundaries of specified project areas. Please refer to Figure 5.

36170_MT_Phase2_2020_B20
Work Unit 230589 Lidar Coverage

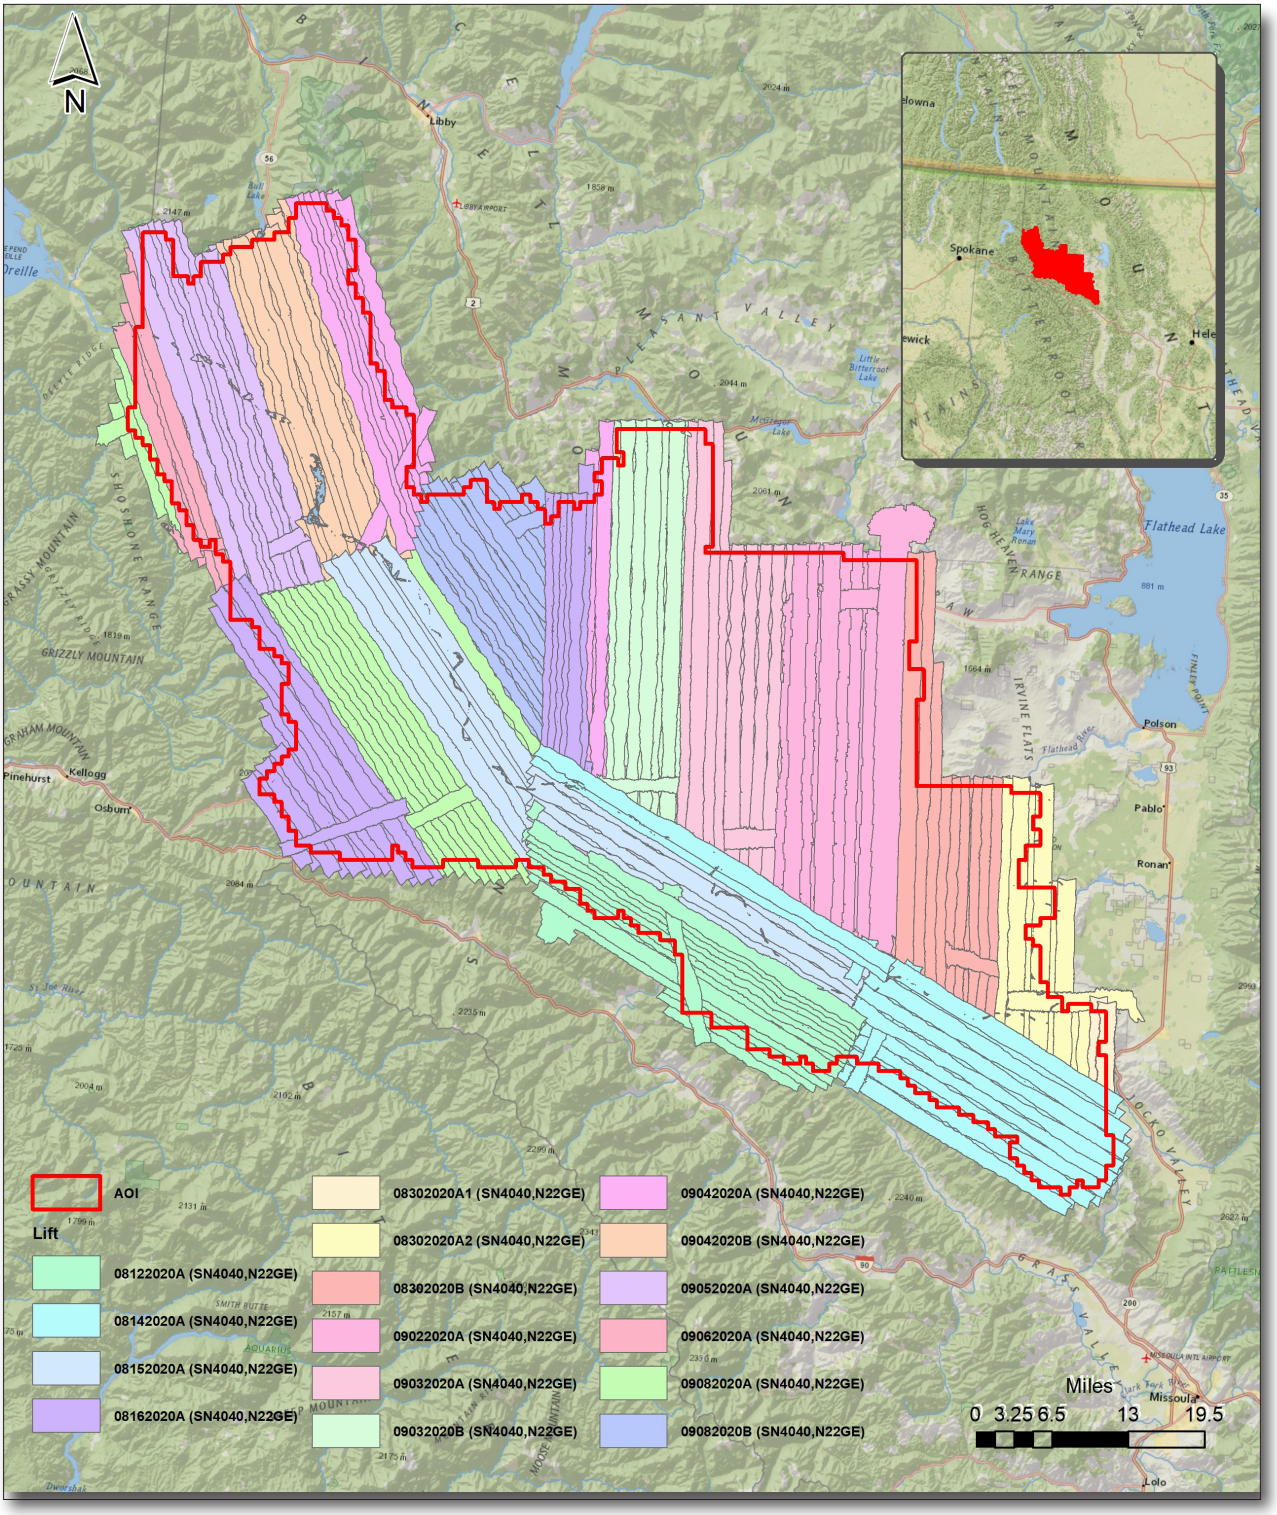

Figure 5. Lidar Coverage

5. Geometric Accuracy

5.1. Horizontal Accuracy

Lidar horizontal accuracy is a function of Global Navigation Satellite System (GNSS) derived positional error, flying altitude, and INS derived attitude error. The obtained $RMSE_r$ value is multiplied by a conversion factor of 1.7308 to yield the horizontal component of the National Standards for Spatial Data Accuracy (NSSDA) reporting standard where a theoretical point will fall within the obtained radius 95% of the time. Based on a flying altitude of 2305 meters, an IMU error of 0.002 decimal degrees, and a GNSS positional error of 0.015 meters, this project was compiled to meet 0.25 meter horizontal accuracy at the 95% confidence level. A summary is shown below.

Horizontal Accuracy	
$RMSE_r$	0.47 ft
	0.14 m
ACC_r	0.82 ft
	0.25 m

5.2. Relative Vertical Accuracy

Relative vertical accuracy refers to the internal consistency of the data set as a whole: the ability to place an object in the same location given multiple flight lines, GPS conditions, and aircraft attitudes. When the lidar system is well calibrated, the swath-to-swath vertical divergence is low (<0.10 meters). The relative vertical accuracy was computed by comparing the ground surface model of each individual flight line with its neighbors in overlapping regions. The average (mean) line to line relative vertical accuracy for the 36170_MT_Phase2_2020_B20 project was 0.063 feet (0.019 meters). A summary is shown below.

Relative Vertical Accuracy	
Sample	186 flight line surfaces
Average	0.063 ft
	0.019 m
Median	0.072 ft
	0.022 m
RMSE	0.073 ft
	0.022 m
Standard Deviation (1σ)	0.017 ft
	0.005 m
1.96σ	0.034 ft
	0.010 m

Notes

Flew lines on the MTStatewide West project near MSO

Got lift early but wx picked up quickly and ceiling began to drop about 2 hours in, rain by the time we landed

Clouds started forming after a few hours, otherwise a great day

Another good day, lots of clouds forming during acq though

smooth air until about noon, clouds forming in the afternoon.

Great day, almost zero clouds in the whole range. Tried for a second lift but had 40-50 knot gusts and shear winds.

clear, smooth.

Another great day over gorgeous mountains, winds much more calm
beautiful morning, turbulence began around 10 am, we moved to north south lines around 11 to see if that helped, it didnt.

Morning and early afternoon were rainy and cloudy, got a later lift and had lots of low clouds and turbulence.

Got a later lift and did a little acq until turb and rain hit.
Bumpy all day over the mountains, but flew until we needed fuel.

Got the Mt Cnty reflies plan then jumped back up north to work on QL1 Montana Statewide plan.

We headed up and got a few lines in over the valley, we went to target the rest of our lines over the mountains and started getting rocked. Extremely violent downdrafts made it unable to climb so we had to call it.

2 lifts today. Second lift was a bit turbulent with some up and down drafts.

1 lift today. Clouds popped above us then dropped creating turbulence and +\- 1000' up\down drafts. We were unable safely to hold the line. Jamon arrived today.

2 lifts today. Some light turbulence otherwise smooth and cloud free.

2 lifts today. Clear Skies. Epic Day.

We flow on the southern block of the AOI and were able to acq all of that block before fuel needs. Good day of acq.

Thick haze today, but ranges were good and we could see though the smoke haze. We hit turbulence in the early afternoon and the plane performance was having trouble keeping up with the environmental conditions. Good day of acq. Plane is being hangered due to predicted wind and possible snow.

1 lift. Smoky Hazy Conditions.

1 lift today to wrap up the Idaho Reflights and then continued on MT.No Second lift due to pilot fatigue. Smooth Clear.

Got off to an early start today, but after a couple hours of flying, northern low clouds drifted in and were unable to thread the needle. Got a good chunk acquired of the AOI, before we were pushed out by the system rolling in.

2 Lifts today. Finished the West QL2 Flight lines. Smooth and Clear Skies.

The mountains were covered with a fresh coat of snow powder this morning, so we were unable to collect. AW provided us with a possible new plan for tomorrow and also more lines on the east of our current AOI. We attempted to collect there, but ran into snow on the northern section of the lines. We decided to run 3 lines and then we ran into clouds on the last line. I transferred this to Darth and will add to tomorrow deliverable, as I believe that the data needs to be reflown anyways.
After a successful morning acq flight collecting the southern block in the eastern AOI, we headed back to KGPI for fuel.

2 lifts today. Smooth Clear. No Snow.

2 lifts today. Smooth Clear. No Snow.

Lift 1 - Laser worked fine. Smoke in area made it unsafe to navigate in the mtns. Moved to the lower lying areas as the visibility was better and Chad said the Wind Shear was too much to continue. Headed back to GTF for fuel.

Lift 2- Flew down near Lewistown MT to finish lines 455-459

Acquired lines 144-155 of Statewide MT - East QL2/ Phase 2 AOI in hazy smoky layer conditions just below operational altitudes. Received good returns as monitored by RiAcquire.

Crew of N22GE performed 2 lifts today. First lift completed lines 193-209 of MT Statewide East QL2 AOI. Second lift consisted of lines 427 reflight, 8-9 of MT Statewide QL1 AOI.

Crew of N22GE acquired lines 3-7 and 296PR2 of MT Phase2 Statewide QL1 AOI on a single lift.

Acquired 1 whole line and 2 partial reflights of Phase 2 Priority QL1 lines of 36170 MT AOI in scattered cloud conditions. Line 295 may require reflight of portions of southern 21 nm due to clouds and severe pitch on mount during flight.

Took off as soon as the plane was released from MX. Flew a short lift as the left engine was running hot. Landed to check if the cowl was closed and talk to mechanic before he went home. Cowl Flap was closed so we opened it back up.

2 lifts today to wrap up the secondary lines.

Mob from McCall to Kalispell today. Collected upon arrival. Conditions clear and smooth.

One lift today after the morning fog burned.

It was too turbulent to go back up.

Late start today due to fog. Flew on our high elev block until turbulence picked up.

Mostly clear skies today except for in our AOI! We got as many lines as we could before we were clouded out. Stood by for it to clear but it did not.

Went up to collect on high elevation and reflies, but AOIs were clouded out. We landed and received instruction to fly on the East side of the mountains, so we went back up and collected.

One lift today after plane was released from MX. Attempted the lines 190 tracking east first but it was way too turbulent near the mountains so we fell back on lines over the plains

Jamon called and coordinated with DHS this AM. We took off and aimed for the NW lines. Got onsite and there were clouds. Attempted ACQ and Aborted. Flew to the Sept21,23 Reflight areas and captured those. Checked the northern lines again and they were still cloudy so we flew lines 190-194 and landed. SBM had the Mechanic do some work on the Prop. Plane is now back in service.

2 lifts today. Mountain lines were clouded out.

Flew a lift in the AM. Tried for the westernmost lines but the turbulence was too bad. Moved east until we found a spot to work in. Landed and swapped the sensor to 704MD. Ran the system up on the ground and all seemed operational.

Very windy, so we stuck to n-s at lower altitudes lines to avoid shear. Wanted to go for a double lift but ceiling descended and we had to head back.

MT_Statewide_East_1560i_QL2

QSI Project #	R036170	
Project Point Density (pts/m	2 ppms	
Sensor Name	VQ 1560i	
Please Ship Data to:	LEX	
Flight Plan Settings		
Mission Parameter	**Scanner 1**	**Scanner 2**
Planned Altitude AGL (m)	2305	2305
Target Speed (kts)	145	145
Scanner Parameter		
Measurement Program (PRR)	350	350
Laser Power (%)	100	100
Measurement Output (range/wf	Range	Range
MTA Zone	DEM	DEM
Line Start/Stop	60° / 120°	60° / 120°
Effective FOV (°)	58.5	58.5
Line Speed/Increment	ress Uniform Point Spacin	

Additional Flight Paramaters	
Max Bank Angle in Turns (°)	20
Minimum Line Overlap (%)	55

Laser Safety Parameters	
NOHD (m)	238
ENOHD (m)	1584

Accepted
Refly
N/A

QSI Project #	R036170	
Project Point Density (pts/m	2 ppms	
Sensor Name	VQ 1560i	
Please Ship Data to:	LEX	
Flight Plan Settings		
Mission Parameter	**Scanner 1**	**Scanner 2**
Planned Altitude AGL (m)	2305	2305
Target Speed (kts)	145	145
Scanner Parameter		
Measurement Program (PRR)	350	350
Laser Power (%)	100	100
Measurement Output (range/wf	Range	Range
MTA Zone	DEM	DEM
Line Start/Stop	60° / 120°	60° / 120°
Effective FOV (°)	58.5	58.5
Line Speed/Increment	ress Uniform Point Spacin	

Additional Flight Paramaters

Max Bank Angle in Turns (°)	20
Minimum Line Overlap (%)	55

Laser Safety Parameters

NOHD (m)	238
ENOHD (m)	1584
