# 1. Overview

## About

This project contains a comprehensive outline of the 140G0220F0194 - OH Statewide Phase 2 2020 B20 task order issued by the United States Geological Survey's National Geospatial Technical Operations Center (USGS-NGTOC). This task order called for the acquisition and processing of QL0 and QL1 data covering approximately 12,101 square miles in southern Ohio (Figure 1-1).

This report encompasses the Work Unit 197533 area of interest (Figure 1-2). This AOI totals approximately 1,096 square miles and includes the following counties:

- Fairfield
- Gallia
- Morgan

#### Purpose

This project will support the 3DEP mission, the Natural Resources Conservation Service (NRCS) high resolution elevation enterprise program and the Federal Emergency Management Agency (FEMA) Risk Mapping.

## Specifications

Data for this task order was acquired and produced to meet National Geospatial Program Lidar Base Specification Version 2.1 and American Society for Photogrammetry and Remote Sensing, 2014

### **Spatial Reference**

Geospatial data products were produced using the following horizontal and vertical spatial data reference system information listed in Table 1-1.

Horizontal	EPSG Code	6551
	Datum	NAD83(2011)
	Projection	State Plane Ohio South (FIPS 3402)
	Units	US Survey Feet
Vertical	Datum	NAVD88
	Geoid	GEOID18
	Units	US Survey Feet
	Height Type	Orthometric

#### Table 1-1. Spatial Reference System

#### Figure 1-1. Project Area

#### Figure 1-2. Project Area - 197536 - 197533

### Task Order Deliverables

All data products produced as part of this task order are listed in Table 1-2. All tiled deliverables had a tile of 1,250-feet x 1,250 feet. Tile names are derived from the Ohio (OGRIP) naming schema.

Example: BS20820365

This delivery's tiled dataset contains a total of 19,553 tiles. One tile was excluded from the Intensity and Maximum Height Separation Raster (MHSR) as it fell over a water body.

Excluded tile:

• BS19780702

#### Table 1-2. Deliverables

Lidar Data			
Classified lidar point cloud data	Tiles in LAS v1.4 format Classes • 1 – Processed, but unclassified • 2 – Bare-earth ground • 7 – Low Noise • 9 – Water • 17 – Bridge Decks • 18 – High Noise • 20 – Ignored Ground		
Breaklines used for hydro- flattening	<ul> <li>Lake and River features as feature classes in an Esri file geodatabase</li> <li>Water bodies greater than 2 acres as polygon features</li> <li>Rivers 30.5 meters / 100 feet and greater in width as polyline features</li> <li>Bridges used in DEM generation as point features in Esri shapefile format</li> </ul>		
Hydro-flattened bare earth digital elevation model (DEM)	1.25-foot pixel size, 32-bit floating-point; no bridges or overpass structures GeoTIFF format		
Intensity imagery	1.25-foot pixel size, 8-bit gray-scale (linear rescaling from 16-bit intensity) GeoTIFF format		
Vertical Accuracy Data			
Ground control survey report Survey report in PDF format

# 2. Acquisition

## Flight Planning

Acquisition was planned based on the task order specifications listed in Table 2-1

Table 2-1. Acquisition Requirements

Specification	Target
Resolution	<ul><li>12 points per square meter</li><li>0.29-meter nominal point spacing</li></ul>
Overlap	At contractor's discretion, but enough to ensure there are no data gaps between usable portions of the swath and to ensure the aggregate nominal point density (ANPD) is achieved
Acquisition Window	Fall 2020 through Winter 2021
Data Voids	<ul> <li>Not allowed except</li> <li>Where caused by water bodies</li> <li>Where caused by areas of low near infra-red (NIR) reflectivity (i.e. asphalt or composition roofing)</li> <li>Where caused by lidar shadowing from buildings or other features</li> <li>Where appropriately filled-in by another swath</li> </ul>
Data Acquisition Conditions	<ul> <li>Atmospheric</li> <li>Cloud and fog-free between the aircraft and ground</li> <li>Ground</li> <li>Snow free</li> <li>No unusual flooding or inundation, except in cases where the goal of the collection is to map the inundation</li> <li>Vegetation <ul> <li>Leaf-off is preferred</li> <li>Time of Day</li> <li>Time of day is not of concern</li> </ul> </li> </ul>

Flight plans were created using Leica MissionPro software.

### Lidar Sensor Information

Aerial lidar data was acquired for this project using the following lidar sensor systems:

- Terrain Mapper serial number 91511, last calibrated July 3, 2019
- Terrain Mapper serial number 91515, last calibrated June 27, 2019
- Terrian Mapper serial number 91557, last calibrated July 1, 2020

Table 2-2 depicts a summary of sensor information. See Appendix 1 for the sensor calibration reports.

#### Table 2-2. Leica Terrain Mapper Sensor Info

Sensor Specifications			
Operating Altitude (m AGL)	300 - 5,500 at 10% reflective target		
Maximum Measurement Rate (kHz)	2,000		
Scan Angle	20 - 40		
Scan Width	Up to 70% of flight altitude		
Scan Frequency	Programmable up to 125 Hz (7,500 RPM), 250 scan lines per second		
Number of Returns	15		
Number of intensity measurements	15		
Pulse Mode(s)	Up to 35 pulses in air		
Laser Specifications			
Laser Beam Divergence	0.25 mrad (1/e)		
Laser Classification	Class 4 laser product		
Accuracy			
Range Resolution	< 1 cm RMS		
Elevation Accuracy	< 5 cm 1 σ		
Horizontal Accuracy	< 13 cm 1 σ		
Physical Specifications			
Size (cm), Weight (kg) • Scanner • Control Electronics	• 37 W x 68 L x 26 H cm, 47 kg • 45 W x 47 D x 25 H cm, 33 kg		
Operating Temperature <ul> <li>Scanner</li> <li>Control Electronics</li> </ul>	<ul> <li>0 - 40°C cabin-side temperature</li> <li>0 - 40°C</li> </ul>		
Flight Management	Leica FlightPro		
Power Consumption	922 W @ 22.0 – 30.3 VDC

## Lidar Sensor Settings

Aerial lidar was acquired using the sensors and settings listed in the Table 2-3.

Table 2-3. Lidar Sensor Settings

Settings	Terrain Mapper
Max. Number of Returns	15
Nominal Point Spacing	0.29 m
Nominal Point Density	12 ppsm
Flying Height Above Ground Level	1,372 m
Flight Speed	130 knots
Scan Angle	40°
Scan Rate Used	150 Hz
Pulse Rate Used	1,320.0 kHz
Multi-Pulse in Air	Enabled
Swath Width	999 m
Swath Overlap	25%

### Timeline

Lidar data was collected from December 11, 2020 through April 13, 2021. A total of 163 individual flight lines were collected. Figure 2-1 shows aerial lidar coverage by lift.

For more information, see the Flight Logs in Appendix 2.

## **GNSS and IMU Equipment**

Prior to mobilizing to the project site, flight crews coordinated with the necessary air traffic control personnel to ensure airspace access. Crews were on-site, operating a Global Navigation Satellite System (GNSS) Base Station for the airborne GPS support.

Flight navigation during acquisition was performed using Leica Flight Pro Navigation system. The pilots are skilled at maintaining their planned trajectory, while holding the aircraft steady and level. If atmospheric conditions are such that the trajectory, ground speed, roll, pitch and/or heading cannot be properly maintained, the mission is aborted until suitable conditions occur.

Base stations were set by acquisition staff and was used to support the aerial data acquisition. Table 2-4 lists the Station ID and coordinates for all base stations operated during acquisition.

For more information, see the GPS/IMU graphics in Appendix 3.

#### **Acquisition Quality Assurance**

An initial quality control process was immediately performed on to review the data coverage, airborne GPS data, and trajectory solution.

Woolpert developed a quality assurance and validation plan to ensure the acquired lidar data meets the USGS Base Specification requirements. For quality assurance purposes, the lidar data was processed immediately following acquisition to verify the coverage has appropriate density, distribution, and no

unacceptable data voids. Accompanying GPS data was post processed using differential and Kalman filter algorithms to derive a best estimate of trajectory. The quality of the solution was verified to be consistent with the accuracy requirements of the task order. Any required re-flights were scheduled at the earliest opportunity.

The spatial distribution of the geometrically usable first return lidar points was reviewed for density requirements as well as regular and uniform point distribution - verifying the lidar data is spaced so that 90% of the cells in a 2\*NPS grid placed over the data contain at least one lidar point. The NPS assessment is made against single swath, first return data located within the geometrically usable center portion (typically ~90%) of each swath. Additionally, the data was reviewed for unacceptable data voids – verifying no area greater than or equal to  $(4 \times ANPS)^2$  exhibited data coverage gaps.

# 3. Processing

### **Processing Summary**

Once the lidar data passed initial QC, the dataset was corrected for aircraft orientation and movement. This process used airborne inertial, orientation, and GPS data collected during acquisition along with ground-based GPS data. The data went through a geometric calibration that further corrected each laser point. This calibrated data set was used to create the LAS point cloud. The LAS point data was initially classified into "ground" and "non-ground", then further refined using the classes specified in this task order. Breaklines were drawn to denote hydrological features. After the hydro-flattening process, the final deliverables products were created.

### **GPS-IMU Trajectory Processing**

Kinematic corrections for the aircraft position were resolved using aircraft GPS and static ground GPS (1-Hz) for each geodetic control (base station) for three subsystems: inertial measurement unit (IMU), sensor orientation information, and airborne GPS data.

Post-processing of the IMU system data and aircraft position with attitude data was completed to compute an optimally accurate, blended navigation solution based on Kalman filtering technology, or the smoothed best estimate of trajectory (SBET).

For more information, see the GPS/IMU graphics in Appendix 3.

Software: Novatel Inertial Explorer v8.70.6129

#### **Trajectory Quality**

The GNSS trajectory and high-quality IMU data are key factors in determining the overall positional accuracy of the final sensor data. Within the trajectory processing, there are many factors that affect the overall quality, but the most indicative are the combined separation, the estimated positional accuracy, and the positional dilution of precision (PDOP).

#### **Combination Separation**

Combined separation is a measure of the difference between the forward-run and the backward-run solution of the trajectory. The Kalman filter was processed in both directions to remove the combined directional anomalies. In general, when these two solutions match closely, an optimally accurate and reliable solution is achieved.

The data for this task order was processed with a goal to maintain a combined separation difference of less than ten (10) centimeters.

#### **Estimated Positional Accuracy**

Estimated positional accuracy plots the standard deviations of the east, north, and vertical directions along a time scale of the trajectory. It illustrates loss of satellite lock issues, as well as issues arising from long baselines, noise, and/or other atmospheric interference.

#### PDOP

The PDOP measures the precision of the GPS solution in regard to the geometry of the satellites acquired

and used for the solution.

The data for this task order was processed with a goal to maintain an average PDOP value below 3.0. Brief periods of PDOP over 3.0 are acceptable due to the calibration and control process if other metrics are within specification.

#### **Geometric Calibration**

After the initial phase was complete, a formal reduction process was performed on the data. Laser point position was calculated by associating the SBET position to each laser point return time, scan angle, intensity, etc. Raw laser point cloud data was created for the whole project area in LAS format. Automated line-to-line calibrations were then performed for system attitude parameters (pitch, roll, heading), GPS/IMU drift. Statistical reports were generated for comparison and used to make the necessary adjustments to remove any residual systematic error.

For more information, see the Sensor Calibration Report(s) in Appendix 1.

Software: Proprietary Software, TerraMatch v21.002, HxMap 3.4

### Relative Accuracy: Interswath (Overlap) Consistency

Interswath or overlap consistency was assessed at multiple locations within overlap in non-vegetated areas containing only single returns and located in areas with slopes of less than 10 degrees. To the extent allowed by the data, test areas were chosen where the full width of the overlap was represented. These overlap areas include adjacent, overlapping parallel swaths within a project, cross-tie swaths and a sample of intersecting project swaths in both flight directions, and adjacent, overlapping lifts.

This project required the interswath accuracy to meet  $\leq 8$  cm RMSDz. Accuracy was assessed in accordance with the USGS Base Specification v2021 revision A.

The interswath consistency results were produced as polygon features in Esri shapefile format. Table 3-1 lists the interswath test results. Figure 3-1 depicts the location of the interswath test locations.

Minimum (m)	Maximum (m)	RMSDz (m)
-0.0300000000	0.0600000000	0.0400000000
-0.0500000000	0.0300000000	0.0200000000
-0.0200000000	0.11000000000	0.0500000000
-0.0600000000	0.0900000000	0.0300000000
-0.1200000000	0.0700000000	0.0200000000

-0.0900000000	0.0200000000	0.0200000000
-0.0800000000	0.0100000000	0.0300000000
-0.0500000000	0.0300000000	0.0200000000

Table 3-1. Interswath Results

#### Figure 3-1. Interswath Testing Locations

### **Relative Accuracy: Intraswath Precision**

Intraswath precision (or smooth surface precision) was performed on hard surfaces with areas consisting of approximately 100 pixels (ex.: parking lots, large rooftops) and containing only single return lidar points. Sample areas were selected where full width of the swath(s) (left, center, and right) were represented to the extent the data allowed.

This project required the intraswath accuracy to meet  $\leq 6$  cm RMSDz. Accuracy was assessed in accordance with the USGS Base Specification v2021 revision A.

The intraswath precision results were produced as polygon features in Esri shapefile format. Table 3-2 lists the intraswath test results. Figure 3-2 depicts the location of the intraswath test locations.

Minimum (m)	Maximum (m)	RMSDz (m)
-0.4800000000	0.9700000000	0.0500000000
-0.2400000000	0.3800000000	0.0600000000
-0.1400000000	0.2600000000	0.0400000000
-0.1800000000	0.1300000000	0.0500000000
-0.1000000000	0.0900000000	0.0300000000

#### Figure 3-2. Intraswath Testing Locations

### Lidar Data Classification

LAS data was initially classified as ground and non-ground points "first and only" as well as "last of many" lidar returns. Additional filters were created to meet the task order classification specifications. Statistical absolute accuracy was assessed via direct comparisons of ground classified points to ground RTK survey data. Based on the statistical analysis, the lidar data was then adjusted to reduce the vertical bias when compared to the survey ground control of higher accuracy.

The bare-earth (Class 2 - Ground) lidar points underwent a manual QA/QC step to verify the quality of the DEM as well as a peer-based QC review. This included a review of the DEM surface to remove artifacts and ensure topographic quality. After the bare-earth surface is finalized, it is then used to generate all hydro-breaklines through a semi-automated process.

All ground (Class 2) lidar data inside of the Lake Pond and Double Line Drain hydro flattening breaklines were then classified to water (Class 9) using TerraScan/LP360 macro functionality. A buffer of 0.7 meters was also used around each hydro-flattened feature to classify these ground (Class 2) points to Ignored Ground (Class 20). All Lake Pond Island and Double Line Drain Island features were checked to ensure that the ground (Class 2) points were reclassified to the correct classification after the automated classification was completed.

All data was manually reviewed and any remaining artifacts removed using functionality provided by TerraScan and TerraModeler. Global Mapper was used as a final check of the bare earth dataset. GeoCue was then used to create the deliverable industry-standard LAS files. Woolpert proprietary software and LP360 was used to perform final statistical analysis of the classes in the LAS files, on a per tile level to verify final classification metrics and full LAS header information.

Table 3-3 lists the point classifications used.

Class Number	Class Name
Class 1	Processed, but unclassified
Class 2	Bare earth
Class 7	Low noise
Class 9	Water
Class 17	Bridge deck
Class 18	High noise
Class 20	Ignored ground

#### Table 3-3. Classified Point Breakdown

## Hydrologic Flattening

The lidar task order required compilation of breaklines defining the following types of water body features:

Lakes, reservoirs, ponds	Minimum of 2-acres or greater Compiled as closed polygons, collected at a constant elevation
Rivers, streams	Nominal width of 30.5 meters / 100 feet Compiled in direction of flow, with both sides maintaining an equal elevation gradient
Bridge breaklines	Breaklines used to enforce a logical terrain surface below a bridge

Woolpert utilized the following steps to hydrologically flatten the water bodies and for gradient hydrologic flattening of the double line streams within the existing lidar data:

- 1. The newly acquired lidar data was utilized to manually compile the hydrologic features in a 2D environment using the lidar intensity and bare earth surface. Open Source imagery was used as reference when necessary.
- 2. An integrated software approach was applied to combine the lidar data and 2D breaklines. This process "drapes" the 2D breaklines onto the 3D lidar surface model to assign an elevation. A monotonic process is performed to ensure the streams are consistently flowing in a gradient manner. A secondary step within the program verifies an equally matching elevation of both stream edges. The breaklines that characterize the closed water bodies are draped onto the 3D lidar surface and assigned a constant elevation at or just below ground elevation.
- 3. All classified ground points from inside the hydrologic feature polygons were reclassified to water, class nine (9).
- 4. All classified ground points were reclassified from within a buffer along the hydrologic feature breaklines to buffered ground, class twenty (20). The buffer distance was approximately the task order designed nominal pulse spacing distance.
- 5. Breaklines used for bridge removal during the hydrologic flattening were included with the hydrologic breakline geodatabase deliverable.
- 6. The lidar ground points and breaklines were used to generate a digital elevation model (DEM).
- 7. QA/QC for this task was performed by reviewing the hydrologically flattened DEM and hydrologic breakline features. Additionally, a combined approach utilizing commercial off the shelf software and proprietary methods were used to review the overall connectivity of the hydrologic breaklines.

TerraScan was used to add the hydrologic breakline vertices and export the lattice models.

Breaklines defining the water bodies greater than 2-acres were provided as polygon features. Rivers and streams with a nominal minimum width of 30.5 meters (100 feet) were provided as polyline features. All lake and river breaklines compiled as part of the flattening process were provided in an Esri file geodatabase.

Breaklines used for DEM generation were provided as point features in Esri shapefile format.

Software: TerraScan v20, TerraModeler v20, Esri ArcMap v10.7, LP360 v2019.1.30.4

## **Digital Elevation Model**

TerraScan was used to add the hydrologic breakline vertices and export the lattice models. Class 2 (ground) lidar points in conjunction with the hydro breaklines and bridge breaklines were used to create 1.25-foot hydro-flattened bare-earth raster DEM files. Using automated scripting routines within ArcMap, a 32-bit floating point raster GeoTIFF file was created for each tile. Files were produced to the full extents of the tile boundaries. Each surface is reviewed using Global Mapper to check for any surface anomalies or incorrect elevations found within the surface.

Software: TerraScan v20, GDAL 2.4.0, Esri ArcMap v10.7, Global Mapper v20.0

#### **Intensity Imagery**

Lidar intensity data derived from the acquired lidar data was linearly rescaled from 16-bit intensity and provided as 1.25-foot pixel, 8-bit, 256 gray scale GeoTIFF files. Files were produced to the full extents of the tile boundaries.

Software: TerraScan v20, Esri ArcMap v10.7

#### Swath Separation Image

A swath separation image is generated to visualize the DZ between the overlapping areas of the flight lines. To generate this surface a point insertion method is used as the primary algorithm. All returns for all point classes except classes 7 and 18 are used in the calculation for each cell. GSD and color ramp values are dependent on the Quality Level and point spacing for the project. The GSD for the surface is no more then 4 times the NPS of the lidar data rounded to an appropriate whole number. The color ramp for the following QL levels are as follows:

QL1 + QL2

- Less than 8 cm Green
- 8 cm to 16 cm Yellow
- Greater than 16 cm Red

#### QL0

- Less than 4 cm Green
- 4 cm to 8 cm Yellow
- Greater than 8 cm Red

Intensity values are modulated to 50% to ensure that there is no oversaturation of intensities values throughout the surface. After all calculations and surfaces have been made a JPEG2000 mosaic is produced for the DPA

**Software:** LP360 v2018.2.59.5

#### Figure 3-3. Swath Separation Image

### Metadata

FGDC CSDGM/USGS MetaParser-compliant metadata was produced in XML format. The metadata includes a complete description of the task order client information, contractor information, project purpose, lidar acquisition and ground survey collection parameters, lidar acquisition and ground survey collection dates, spatial reference system information, data processing including acquisition quality assurance procedures, GPS and base station processing, geometric calibration, lidar classification, hydrologic flattening, intensity imagery development, and final product development.

Other metadata deliverables included Esri shapefiles of the ground control and QA/QC points, interswath and intraswath test results, data extent, and tile index. A georeferenced, polygonal representation of the detailed extents of each acquired lidar swath was produced as a polygon feature class in an Esri file geodatabase. Swath separation images were produced in GeoTIFF format. Maximum height separation rasters were produced in GeoTIFF format.

# 4. Accuracy Assessment

## Horizontal Accuracy

The data set was produced to meet ASPRS "Positional Accuracy Standards for Digital Geospatial Data" (2014) for a 0.101 ft RMSEx / RMSEy Horizontal Accuracy Class which equates to Positional Horizontal Accuracy = +/- 0.250 ft at a 95% confidence level.

### **Classified Lidar Point Cloud Testing**

This project required Non-Vegetated Vertical Accuracy (NVA) and Vegetated Vertical Accuracy (VVA) to be tested on the classified lidar point cloud data. The dataset was required to meet a target NVA value of 19.6 cm at a 95% confidence level using an RMSEz target value of 10 cm x 1.9600 and a target VVA value of 30 cm at the 95th percentile. Testing was assessed and reported using guidelines developed by the National Digital Elevation Program (NDEP) and the American Society for Photogrammetry and Remote Sensing (ASPRS).

The NVA and VVA values were calculated using independent checkpoints that were not used in the calibration or post processing of the lidar point cloud data. Checkpoints were distributed throughout the project area. NVA checkpoints were located in bare earth and urban (non-vegetated) land cover classes. VVA checkpoints were located in brush/tall grass/weeds (vegetated) land cover classes. These checkpoints were surveyed using GPS techniques. See the survey report for acquisition methodologies.

Testing was performed using TINs created from the final calibrated and controlled swath data. For each NVA checkpoint, an elevation value was derived from the TIN at the point's x,y location. This value was compared to the checkpoint's surveyed elevation value.

The classified lidar point cloud accuracy test results are listed below in Table 4-1.

	Result	Points Used
NVA	0.043 m RMSEz 0.084 m at 95% CL	50
VVA	0.180 at 95th Percentile	39

#### Table 4-1. Classified Point Cloud Vertical Accuracy

### **Digital Elevation Model Testing**

This project required Non-Vegetated Accuracy (NVA) and Vegetated Vertical Accuracy (VVA) testing of the digital elevation model (DEM) dataset. The calculated NVA value was required to meet 19.6 cm at a 95% confidence level using an RMSEz target value of 10 cm x 1.9600. VVA was required to meet 30 cm at the 95th percentile error. Testing was assessed and reported using guidelines developed by the National Digital Elevation Program (NDEP) and the American Society for Photogrammetry and Remote Sensing (ASPRS).

Testing was performed using the bare earth DEM created as part of this task order. For each checkpoint, an elevation value was derived from the DEM at the point's x,y location. This value was compared to the checkpoint's surveyed elevation value.

The NVA and VVA values were calculated using independent checkpoints that were not used in the calibration or post processing of the lidar point cloud data. Checkpoints were distributed throughout the project area. NVA checkpoints were located in bare earth and urban (non-vegetated) land cover classes. VVA checkpoints were located in brush/tall grass/weeds (vegetated) land cover classes. These checkpoints were surveyed using GPS techniques. See the survey report for acquisition methodologies.

The classified lidar point cloud accuracy test results are listed below in Table 4-2.

#### Table 4-2. DEM Accuracy

	Result	Points Used
NVA	0.046 m RMSEz 0.090 m at 95% CL	50
VVA	0.175 at 95th Percentile	29
