REPORT OF SURVEY

USGS SD FY17 NRCS LIDAR

INTRODUCTION

Terrasurv, Inc of Pittsburgh, PA was tasked by Fugro Geospatial with performing a control survey in support of LiDAR data collection covering an area in west central South Dakota. The project consisted of two parts: ground control (GCP, 65 points) and quality control (VVA/NVA, 180 points). The map below in figure 1 shows the layout of the project.

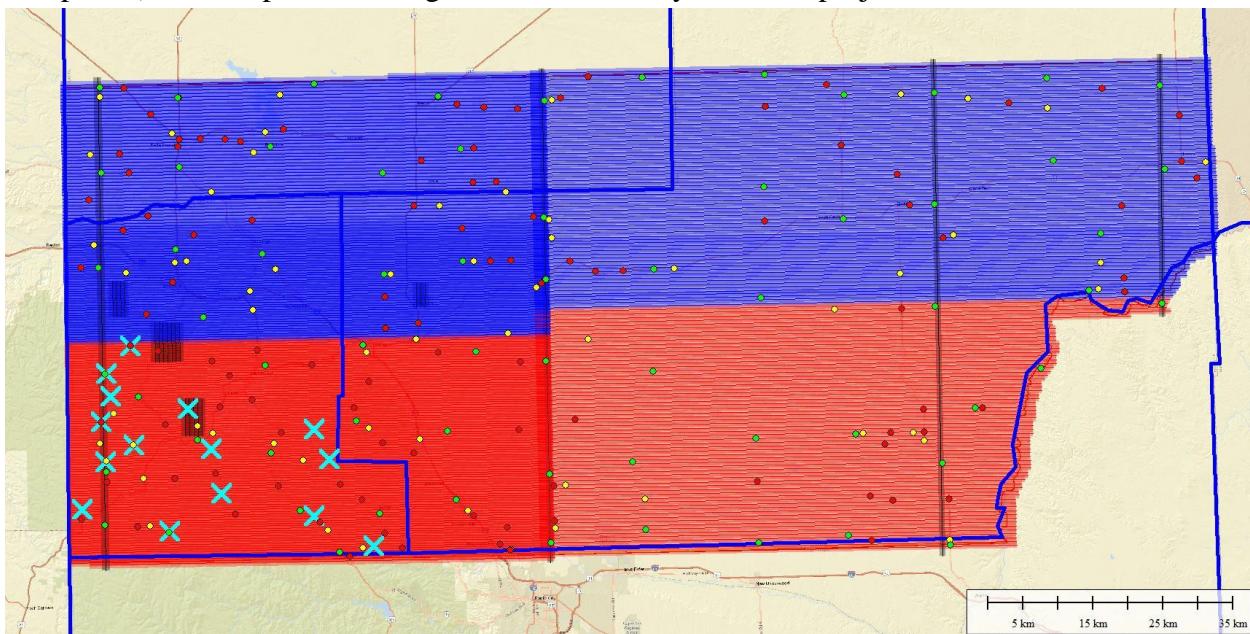

Figure 1 – Flight Lines and Lidar ground control

The green circles show the locations of the 65 GCP stations. The yellow circles are the VVA (non-woods) points, the red circles are the NVA points, and the blue X's are the woods points.

CONTROL

The National Spatial Reference System (NSRS) was used to provide control for the network. Two Continuously Operating Reference Stations (CORS) were included in the network, as well as thirteen existing NSRS benchmarks. Table 1 summarizes the NSRS control. The horizontal datum was the North American Datum of 1983 – NAD83 (2011), epoch 2010.0. The vertical datum was the North American Vertical Datum of 1988 (NAVD88), realized with GEOID12B.

Table 1 - NSRS Control

Station Name	PID	Horizontal Accuracy	Vertical Order	Type of Mark
RAPID CITY CORS ARP (SDRC)	DP1963	CORS	N/A	CORS
NEWCASTLE WY2006 CORS ARP (P043)	DI2251	CORS	N/A	CORS
34 090.10	AB9179	N/A	I-II	Conc Monument

Station Name	PID	Horizontal Accuracy	Vertical Order	Type of Mark
34 058.0	AB9205	N/A	1-II	Conc Monument
JUG	PU1218	3rd*	2-0	Conc Monument
JUG RM 1	PU1219	N/A	2-0	Conc Monument

S 359	PU1998	N/A	2-0	Culvert
I90 002.39	PF0616	N/A	1-II	Steel Pipe

*Note: **JUG** is a third order triangulation station. The published horizontal position is on NAD83 (1996), and was not determined using GPS. **JUG RM 1** and **JUG RM 2** are at the same location, and all three are second order benchmarks.

The distribution of these NSRS stations is shown below in figure 2, along with flight lines. The two CORS are shown as red dots with labels, the benchmarks are shown as red crosses inside white squares.

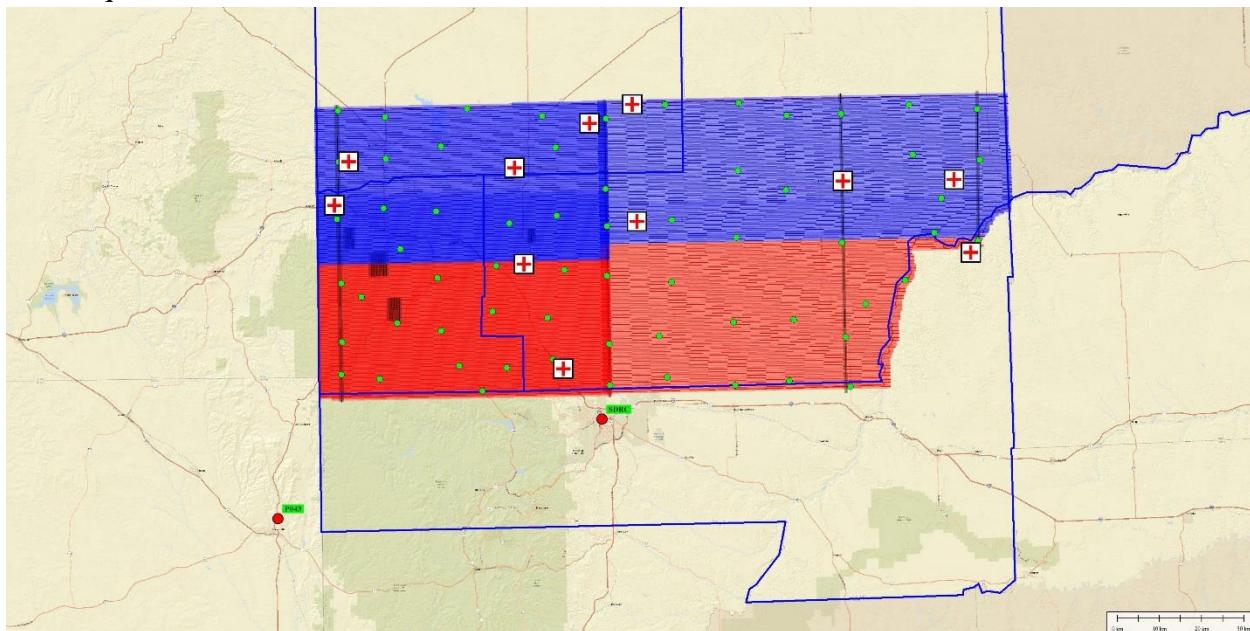

Figure 2 - Continuously Operating Reference Stations (CORS) and NSRS benchmarks used

STATIONS

There were a total of 65 GCP stations. 180 QC points were requested, consisting of 103 NVA (bare ground, low grass, low brush, etc) and 77 VVA (61 high brush, 16 woods). There were actually a total of 104 NVA and 78 NVA points (63 high brush, 15 woods) surveyed. Table 2 lists the stations established in this survey, including traverse stations that were set to enable survey of points in dense woods, as well as the CORS and benchmarks used, as well as the temporary base stations.

METHODOLOGY

The field survey was done by using a combination of static and RTK methods. Temporary base stations (two Trimble R10 dual frequency multi-constellation receivers) were setup each day and were used to transmit corrections via the cellular network to two R8 GNSS rover receivers. The base receivers also collected static data for post processing. At the rover receiver, data is received via the cellular network. The data is processed in real time to compute a position and elevation for the unknown station. The vector data is stored in a data collector as a vector from the base position, along with statistical data for the solution. Each point was surveyed two times in succession, separated by a new initialization. Multiple stations were occupied by the rover receiver in a static mode due to lack of cellular connectivity. Table 3 summarizes the RTK data, precisions in meters):

Table 3 - RTK Occupation Summary

Three occupations were rejected, denoted in the table above by ~~strike-through~~.

Each station had two or more occupations, separated by a re-initialization. The Earth Centered Earth Fixed (ECEF) vector differences were rotated into a local horizon system (NEU) for analysis.

Table 4 - Repeat Baseline Differences (meters)

STATIC OCCUPATIONS AND PROCESSING

As mentioned above, the base occupations had long static data sets. These were used to process against the CORS to provide ties to the NSRS. Static data was also collected at GCP's, VVA's, NVA's, and NSRS benchmarks when cellular data was not available. Table 5 summarizes the static occupations, including the CORS data.

Table 5 - Static GPS Occupation Summary

WOODS VVA CHECK POINTS

The 15 woods checkpoints were surveyed by establishing a pair of intervisible stations in an open area using GPS (Static GPS from a base to one station, and an RTK vector between the two intervisible stations). A Trimble S6 total station was then used to traverse to the woods point. Table 7 lists the conventional observations (mark-to-mark, grads and meters).

Table 7 - Conventional Observations to Woods VVA points

LEAST SQUARES ADJUSTMENTS

Geolab was used to adjust the GPS vectors. No scaling of the apriori GPS statistics was done. Station errors (centering, HI and HT) of 0.005 m were input. The GEOID12B model was used.

The first adjustment constrained the CORS SDRC in all three dimensions (NAD83 (2011) epoch 2010.0 latitude, longitude, and ellipsoidal height). The adjustment had an estimated variance factor of 0.30. The map in figure 3 shows the configuration of the network that was adjusted, with the two CORS shown as green dots and the thirteen NSRS benchmarks shows as red X's.

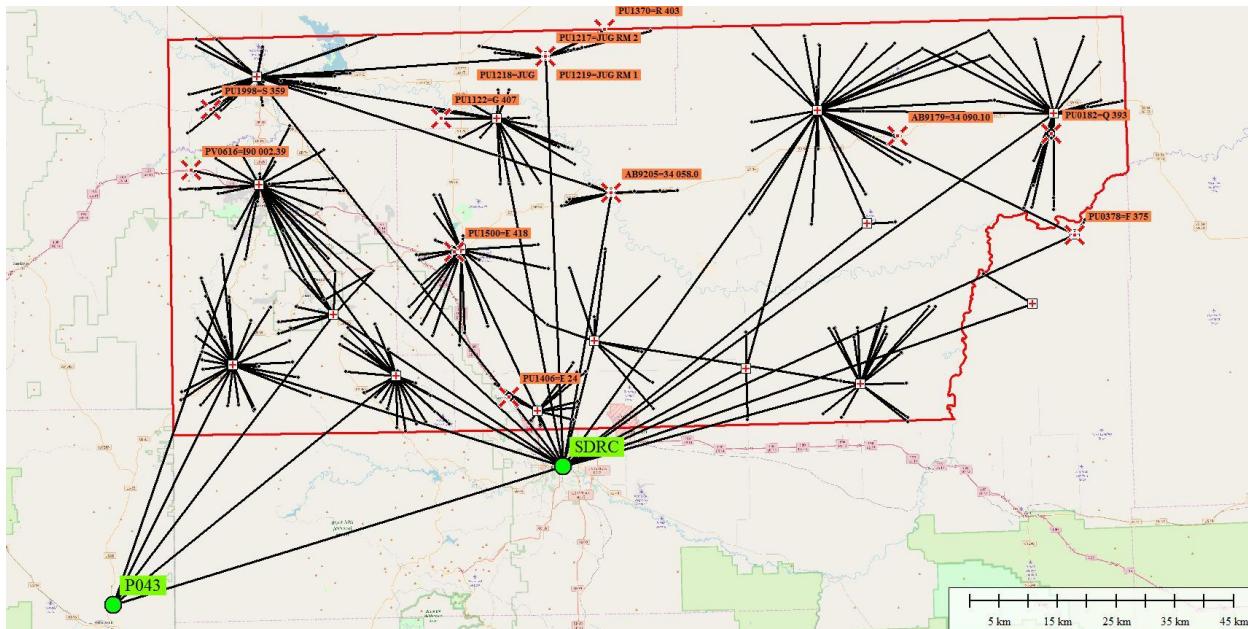

Figure 3 - Network Adjustment

The misclosures at each of the NSRS benchmarks was then checked, as shown in table 8, in meters.

Table 8 - NSRS Misclosures

PID	Azimuth	Distance	Delta Ortho H	Delta Ellip H	Comment
AB9179			+0.023 m		
AB9205			-0.008 m		
PU1218	319°	0.113 m	+0.065 m		Disturbed?
PU1219			+0.095 m		Disturbed?
PU1217			+0.052 m		Disturbed?
PU0182			+0.031 m		

PID	Azimuth	Distance	Delta Ortho H	Delta Ellip H	Comment
PU0378			-0.009 m		
PU1122			-0.008 m		
PU1370			+0.104 m		Disturbed?
PU1406			-0.003 m		
PU1500			-0.005 m		
PU1998			-0.001 m		
PV0616			-0.001 m		
PO43	106°	0.003 m		-0.007 m	CORS

The four stations listed as “Disturbed?” are all concrete posts, and all are higher than published, probably due to frost heave. The three stations at the location of **JUG** show different amounts of movement, against a base that was located approximately 30 meters away. The horizontal position of this station is referenced to NAD83 (1996) and is a third order triangulation derived position. The other mark suspected of being disturbed (**R 403**=PID PU1370) is listed in the original description as projecting 0.4 feet (0.12 m) above ground. As can be seen in figure 4, the station mark currently projects significantly more than that.

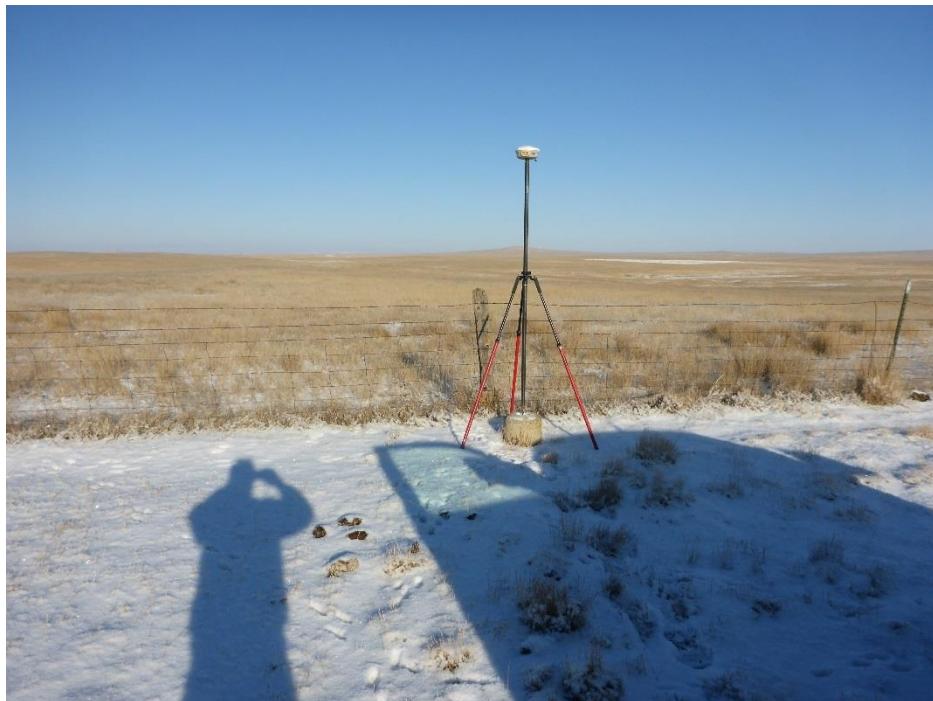

Figure 4 - NSRS Benchmark R 403 (PID PU1370)

The final adjustment constrained the two CORS horizontally (NAD83 (2011) epoch 2010.0 latitude and longitude) and eight of the NSRS benchmarks constrained vertically (NAVD88 orthometric height). The estimated variance factor was 0.30. This adjustment provided the adjusted positions and elevations for the stations in the network. Table 9 lists the station confidence regions (error ellipses) at the 95% level (in meters):

Table 9 - Station Confidence Intervals (95% - meters)

SUMMARY

A LiDAR ground control network consisting of 65 ground control points (GCP) and 180 QC check points was established in west central South Dakota. The estimated accuracy of the control network is ± 0.03 m with respect to the NAD83 (2011) epoch 2010.0 reference frame and the NAVD88 vertical datum.

Adjusted Coordinates – NAD83 (2011) epoch 2010.0/NAVD88

Ellipsoidal Heights=NAVD88+GEOID12B

UTM Zone: 13

Units: meters
