REPORT OF SURVEY

USGS TX POST HARVEY LIDAR

INTRODUCTION

Terrasurv, Inc of Pittsburgh, PA was tasked by Fugro Geospatial with performing a control survey in support of LiDAR data collection covering multiple discrete areas in southeast Texas covering approximately 14,500 square miles (37,600 km²). The project consisted of two parts: ground control (GCP, 115 points) and quality control (VVA/NVA, 455 points). The map below in figure 1 shows the location of the project. Figure 2 is a zoomed in map of the project area.

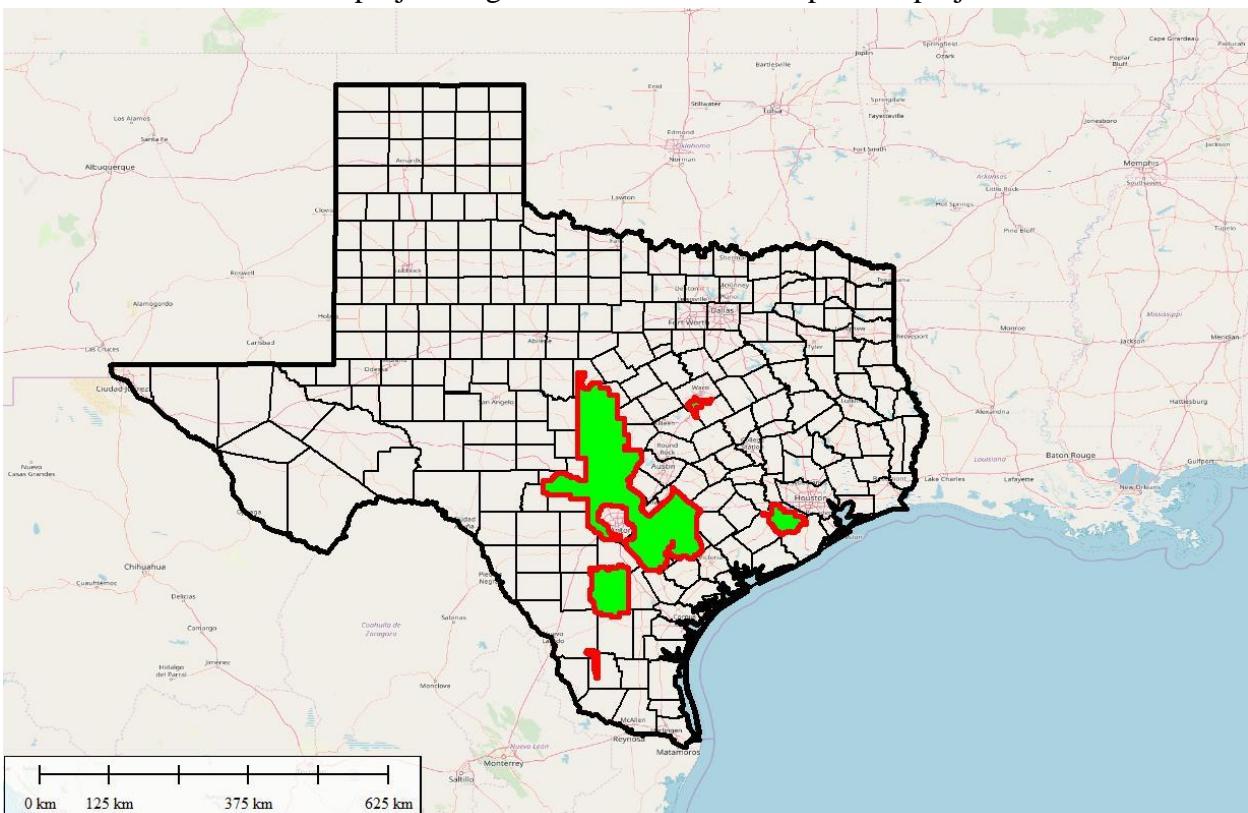

Figure 1 – Project Location

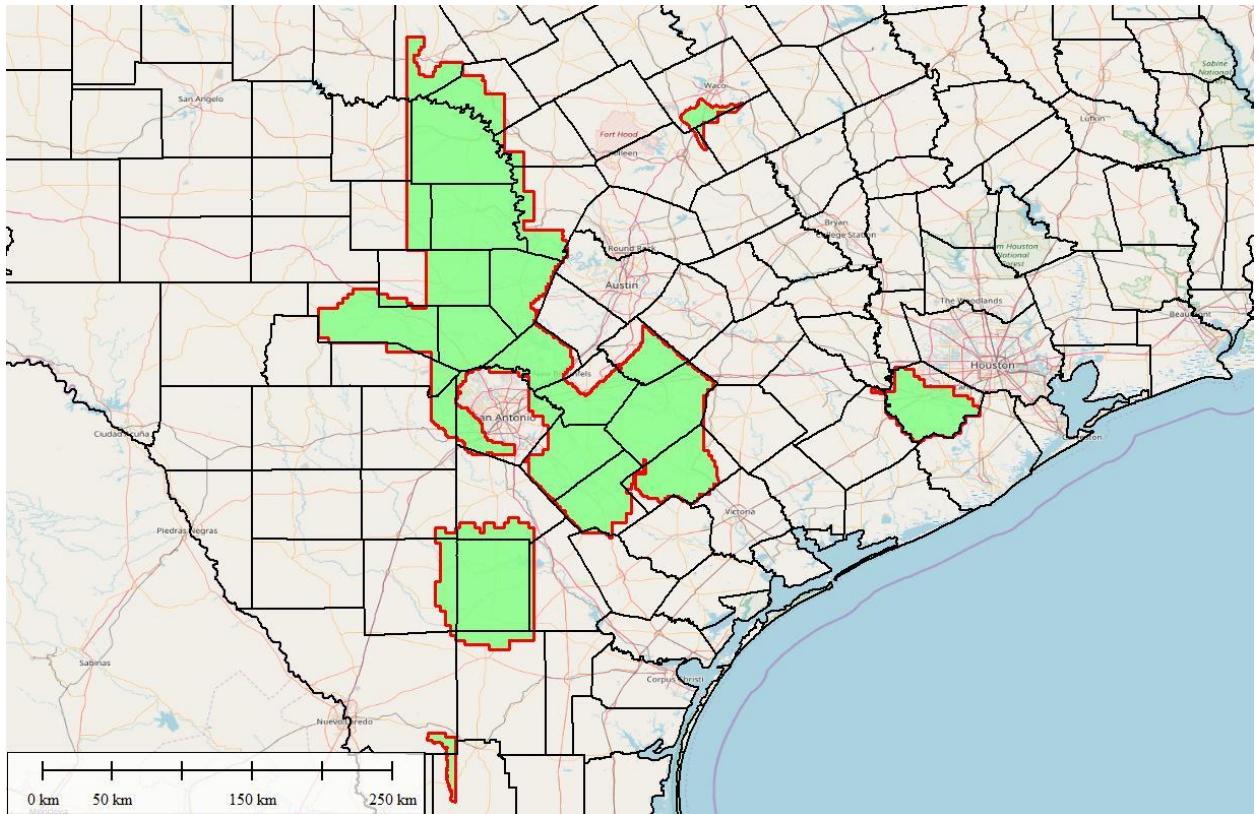

Figure 2 - Project Areas

CONTROL

The horizontal datum was the North American Datum of 1983 – NAD83 (2011), epoch 2010.0. The vertical datum was the North American Vertical Datum of 1988 (NAVD88), realized with GEOID12B.

The [RTKNet](#) Virtual Reference System (VRS) was used along with the [Trimble Centerpoint RTX](#) service to position the stations.

STATIONS

There were 115 GCP stations requested, which are shown in figure 3.

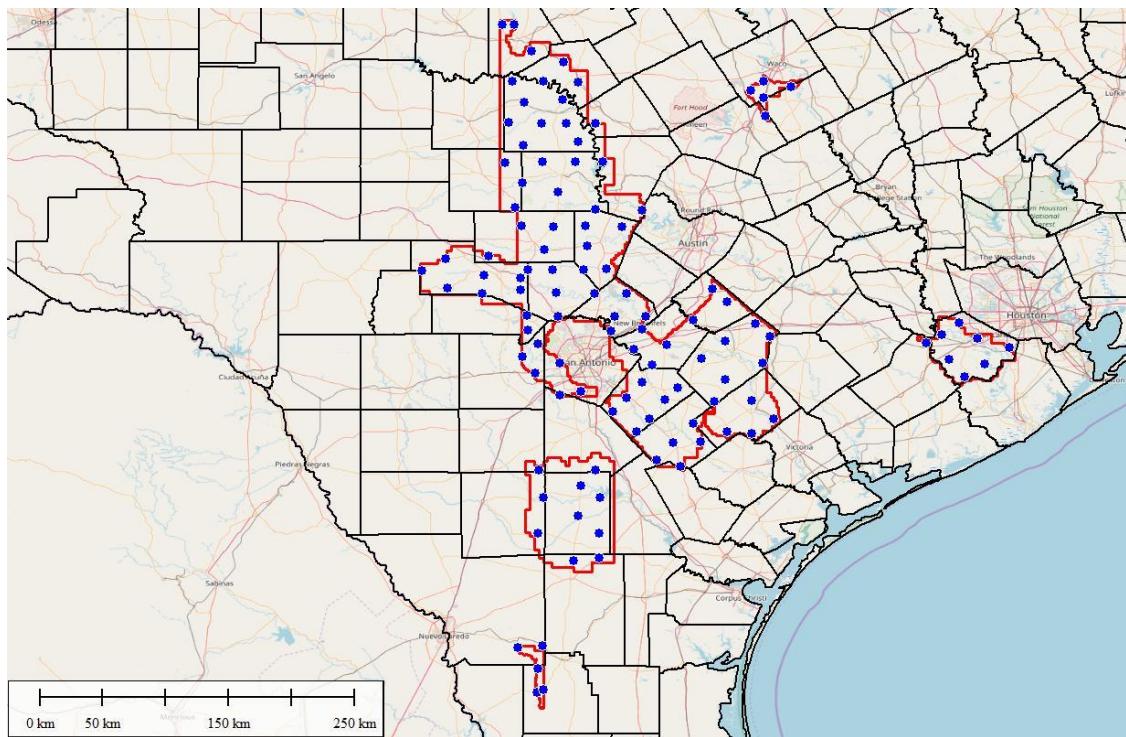

Figure 3 - GCP Stations

A total of 455 CA/QC checkpoints were requested, consisting of 268 NVA, 137 VVA, and 50 VVA Forest.

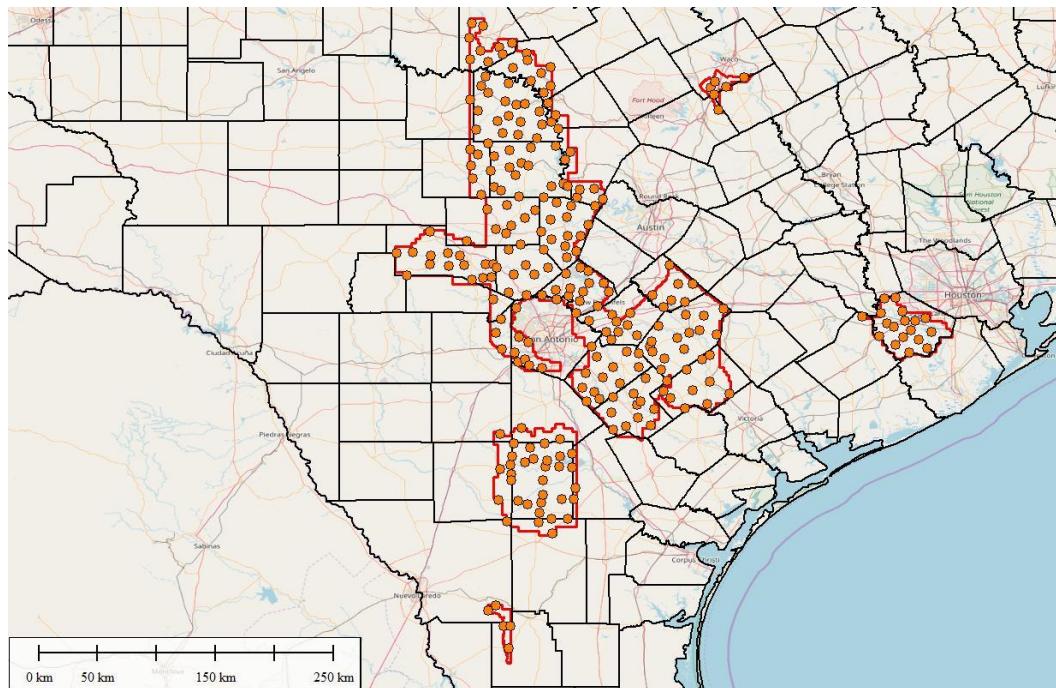

Figure 4- NVA Points

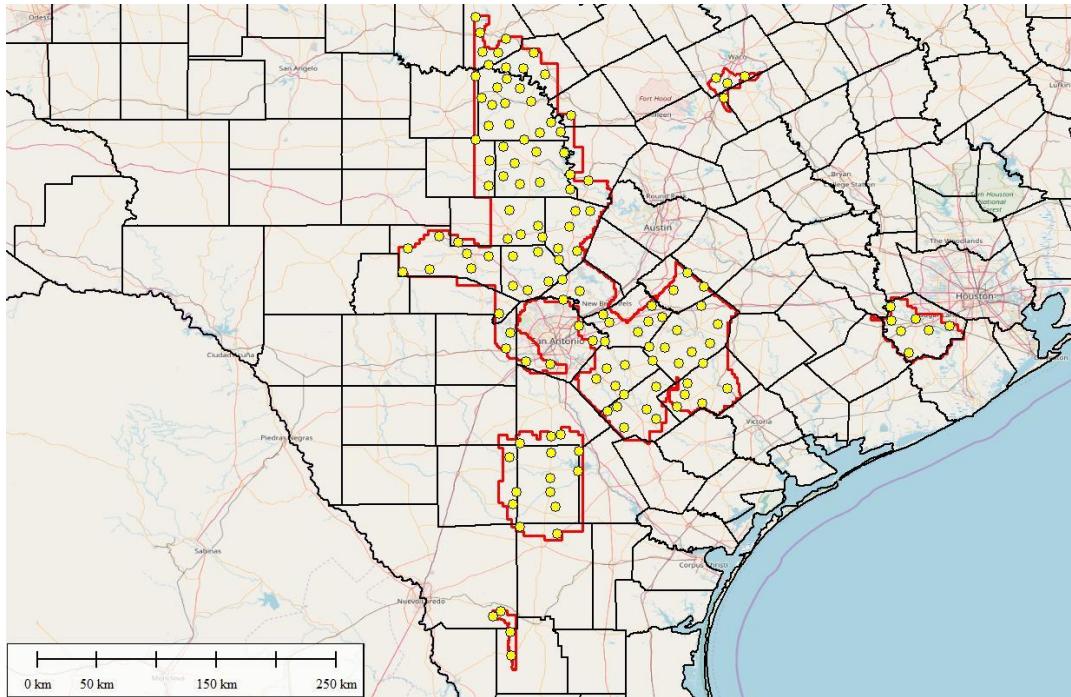

Figure 5 - VVA Points

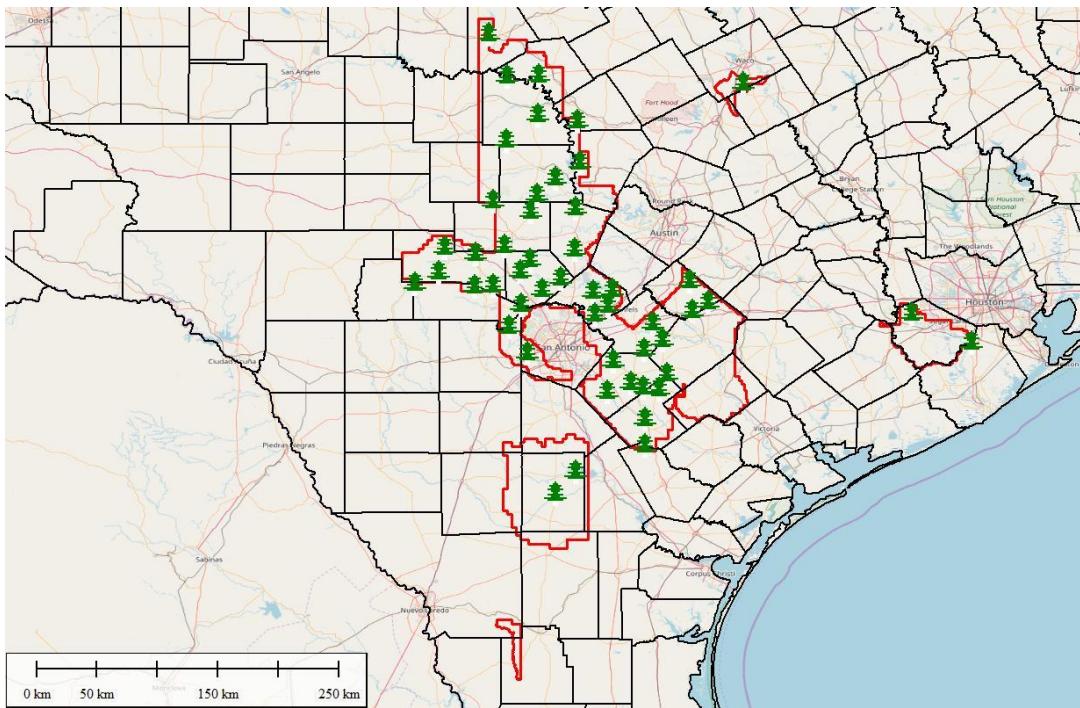

Figure 6 - VVA Forest points

Table 1 lists the stations established in this survey, including traverse stations that were set to enable survey of VVA-Forest points and VRS Continuously Operating Reference Stations (CORS).

METHODOLOGY

The field survey was done by using Trimble R10 dual frequency, multi-constellation GNSS receivers in a real time mode. Two methods were used: RTK/VRS and RTX. In the RTK method a network of Continuously Operating Reference Stations (CORS) send real time observations to a server. The server computes corrections for a nearby “virtual” CORS and transmits this data over the cellular system to the rover, and the corrections are applied at the rover to obtain cm level positions. The data is stored as vectors from the nearest physical CORS. The RTKNet VRS was used where possible, but there were areas where cellular service was not available. In the RTX methods, corrections are obtained using the Trimble Centerpoint RTX service ([RTX](#)), with real-time satellite orbit and clock corrections as well as atmospheric modeling parameters received over a geosynchronous communications link. These corrections are applied in real time, and used by the rover to converge to a solution. Once the convergence criteria (0.03 m H/0.05 m V) was met, one or more short occupations of the station are obtained, and the ITRF 2008 epoch 2005.0 position stored along with quality data.

Table 2 summarizes the VRS occupations (precisions in meters):

The Trimble Centerpoint RTX real time solutions are stored as ITRF2008 epoch 2005.0 positions. The NGS utility Horizontal Time Dependent Positioning (HTDP) was used to transform the ITRF 2008 epoch 2005.0 positions to NAD83 (2011) epoch 2010.0 positions.

WOODS VVA CHECK POINTS

Of the 50 woods checkpoints, 12 were surveyed by direct occupation (VRS or RTX), and 38 were surveyed by establishing a pair of intervisible stations nearby in an open area using a Trimble R10 GNSS receiver (RTX Real Time). A Trimble S6 total station was then used to traverse to the woods point. Table 4 lists the conventional observations (mark-to-mark, grads and meters).

LEAST SQUARES ADJUSTMENTS

Geolab was used to adjust the VRS vectors, RTX positions, and conventional observations. No scaling of the apriori GPS statistics was done. Station errors (centering, HI and HT) of 0.005 m were input. The GEOID12B model was used.

The VRS vectors were combined with the transformed RTX positions (transformed from ITRF08 epoch 2005.0 to NAD83 (2011) epoch 2010.0 using HTDP). This adjustment computed the final adjusted coordinates (latitude, longitude, ellipsoidal heights, and orthometric heights) of the stations in the network. The adjustment had an estimated variance factor of 0.75. A separate adjustment was performed for the VVA forested checkpoints surveyed by RTX, which had an estimated variance factor of 1.78. Table 5 lists the station confidence regions (error ellipses) at the 95% level (in meters) for these adjustments.

SUMMARY

A LiDAR ground control network consisting of 115 ground control points (GCP) and 455 QA/QC check points was established in central Texas. The estimated accuracy of the control network is ± 0.05 m with respect to the NAD83 (2011) epoch 2010.0 reference frame and the NAVD88 vertical datum.

Adjusted Coordinates

Horizontal Datum: NAD83 (2011) epoch 2010.0

Vertical Datum: NAVD88=Ellipsoidal Height-GEOID12B

Units: meters
