Section 1: Overview

TASK ORDER NAME: Zion National Park QL1 and QL2 Lidar

Project: # 75880

This report contains a comprehensive outline of the Zion QL1 and QL2 Lidar Processing task order for the United States Geological Survey (USGS). This task is issued under USGS Contract No. G10PC00057, Task Order No. G15PD00916. This task order requires lidar data to be acquired over Zion National Park in Utah (approximately 233 square miles) collected at a nominal pulse spacing (NPS) of 0.7 meters. An area within the AOI was required to be collected at a nominal post spacing (NPS) of 0.35 meters. The NPS assessment is made against single swath, first return data located within the geometrically usable center portion (typically ~90%) of each swath.

The data was collected using a Dual-Head DragonEye (DE) sensor. The sensor was mounted in a Leica PAV100 gyro-stabilized mount integrated with a NovAtel SPAN GNSS and LCI-100C IMU. This sensor collects up to four returns (echo) per pulse, as well as intensity data, for the first three returns. The aerial lidar was collected at the following sensor specifications:

Table 1.1: Dual-Head DragonEye (DE) Specifications

Post Spacing	0.35 m
AGL (Above Ground Level) average flying height	1500 m
Average Ground Speed:	125 knots / 144 mph
Field of View (full)	40 degrees
Pulse Rate	320/360 kHz
Scan Rate	50 Hz
Side Lap	15%

LiDAR data was produced in NAD83(2011) UTM12N. Coordinate positions were specified in units of meters. The vertical datum used for the project was referenced to NAVD 1988, Meters, GEOID12B.

Figure 1.1: Zion National Park QL2 Lidar Task Order AOI

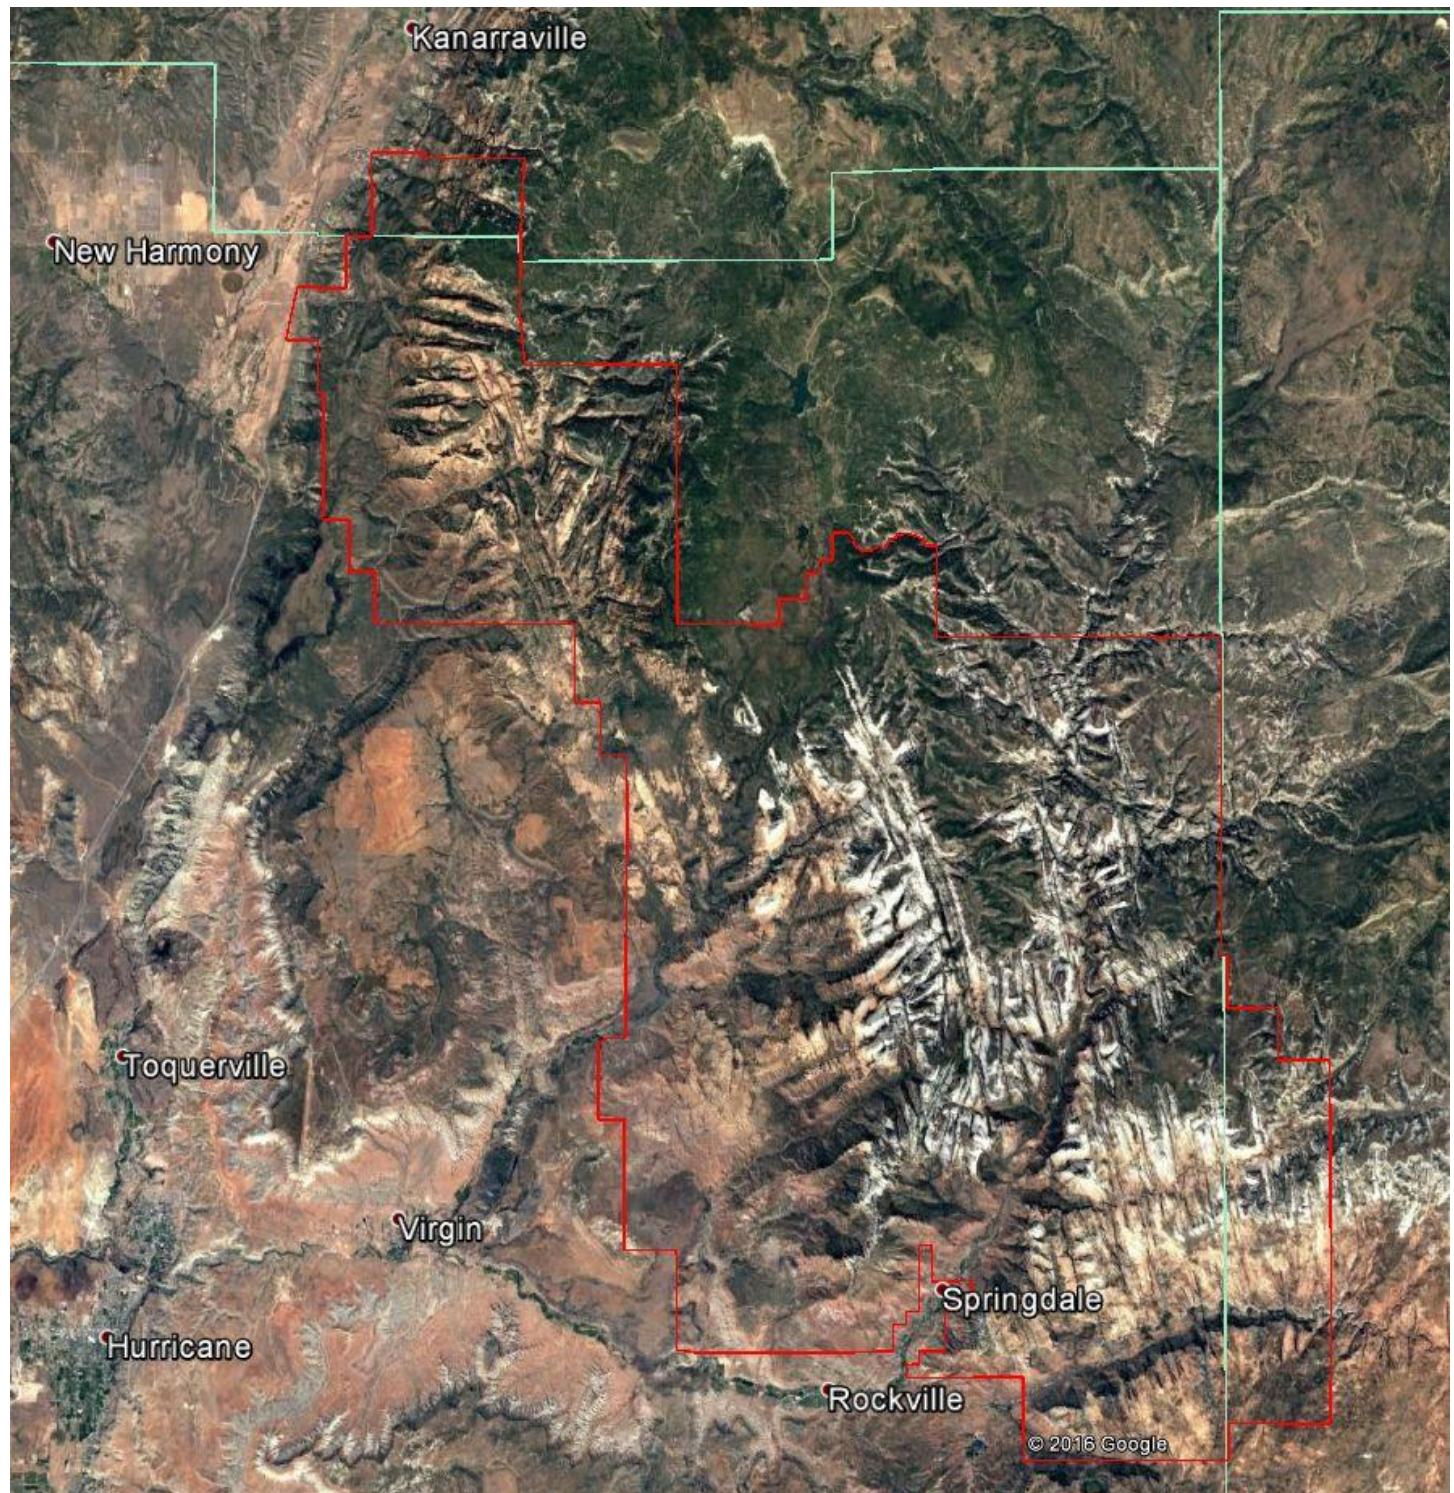

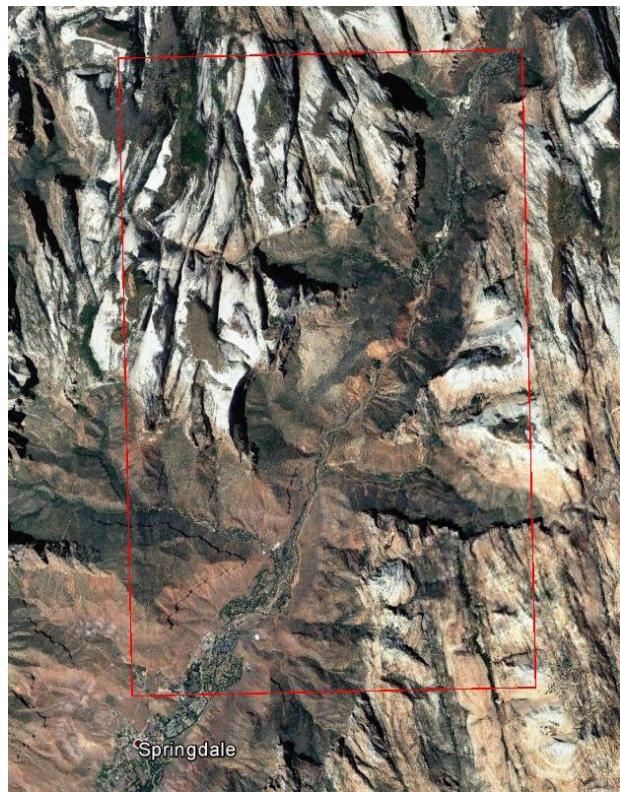

Figure 1.2: Zion National Park QL1 Lidar Task Order AOI

Section 2: Acquisition

The LiDAR data was acquired with a Leica Leica Dual-Head DragonEye (DE) sensor, on board Woolpert's Cessna aircraft. The Leica system, developed by Leica of Herrburgg, Switzerland. The innovative dual scanner head design of the DragonEye features a unique oblique scan pattern. In one single pass, each ground target may be illuminated by four laser shots at multiple incidence angles from ± 8 to ± 20 degrees, maximizing vertical surface definition and minimizing shadows in the survey data. Each topographic laser operates in the infra-red spectrum at 1064nm. Up to 15 returns per pulse are acquired from each laser.

Table 2.1: The Leica DragonEye LiDAR System has the following specifications:

Laser Characterization	
Laser wavelength ⁶⁾	1064 nm
Laser divergence	0.5 mrad ($1/e^2$)
Pulse repetition frequency (PRF)	Up to 1 MHz
Return pulses	Programmable up to 15 returns, with full waveform record option
Operation altitude ¹⁾	300 – 1600 m AGL
Scanner pattern	Dual head oblique scanner
Scanner speed	Programmable up to 70 RPS per scanner (i.e., 280 scans/second)
Field of view	$\pm 8^\circ$ and $\pm 20^\circ$ front/back, $\pm 20^\circ$ left/right
Swath width	70 % of AGL
Point density ²⁾	> 16 pts/m ²
Ranging accuracy ^{2), 3), 4)}	2 cm (1σ)
Vertical accuracy ^{2), 3), 5)}	6 cm (1σ)
Horizontal accuracy ^{2), 3), 5)}	25 cm (1σ)

Prior to mobilizing to the project site, flight crews coordinated with the necessary Air Traffic Control personnel to ensure airspace access.

Crews were onsite, operating a Global Navigation Satellite System (GNSS) Base Station for the airborne GPS support.

The LiDAR data was collected in fourteen (14) missions, flown as close together as the weather permitted, to ensure consistent ground conditions across the project area. An initial quality control process was performed immediately on the LiDAR data to review the data coverage, airborne GPS data, and trajectory solution.

Table 2.2: Airborne Lidar Acquisition Flight Summary

Date of Mission	Lines Flown	Mission Time (UTC) Wheels Up/ Wheels Down
November 14, 2015	70-87, 102-111	15:58 – 20:07
November 15, 2015	1-17, 23-40	17:36 – 22:32
November 17, 2015	1-17	20:22 - 22:35
November 20, 2015	18-23	17:50 - 19:36
June 28, 2016	9, 120-127	16:12 - 17:34
June 29, 2016	9-35	12:13 - 15:53
June 30, 2016	35-69	12:25 - 17:11
July 1, 2016	18-22, 88-101	17:23 -20:06
July 2, 2016	1-8	12:30 - 14:00
July 2, 2016	7-25	17:48 – 20:27
July 6, 2016	1-6, 11-15	12:19 - 17:07
July 7, 2016	57-59, 62-67, 71, 72	12:36 – 17:00
July 8, 2016	1-6	12:32 – 14:00
July 20, 2016	4-20, 42, 43	12:35 – 16:01

Section 3: LiDAR Data Processing

Applications and Work Flow Overview

Initial data coverage analysis and quality checks to ensure there were no potential system issues were carried out in the field prior to demobilization of the sensor. In general, data were initially processed in Leica's Lidar Survey Studio (LSS) using final processed trajectory information. LAS files from LSS were imported to a Terrascan project where spatial algorithms were used to remove gross system noise and a basic ground classification was conducted per flight line for Terra Match use. TMatch was then run on the project, and a comparison to the lidar control points was conducted. Final trajectory data were post processed in NovAtel Inertial Explorer. Base station data were converted to GPB format and imported with aircraft GNSS and IMU data. Inertial Explorer accounts for the fixed offset between the reference point and IMU and uses a multi-pass algorithm to compute a tightly-coupled solution. Lidar processing was conducted using the Leica Lidar Survey Studio (LSS) software. Calibration information, along with processed trajectory information were combined with the raw laser data to create an accurately georeferenced lidar point cloud for the entire survey in LAS v1.2 format. All points from the topographic lasers include 16-bit intensity values. Additional QC steps were then performed in LSS prior to import to Terrascan. For example, spot checks were made on the data to ensure the front and back of the scans remained in alignment and no calibration or system issues were apparent prior to further data editing in Terrascan.

Global Navigation Satellite System (GNSS)-Inertial Measurement Unit (IMU) Trajectory Processing

Equipment

Flight navigation during the LiDAR data acquisition mission is performed using IGI CCNS (Computer Controlled Navigation System). The pilots are skilled at maintaining their planned trajectory, while holding the aircraft steady and level. If atmospheric conditions are such that the trajectory, ground speed, roll, pitch and/or heading cannot be properly maintained, the mission is aborted until suitable conditions occur.

The aircraft is configured with a NovAtel SPAN GNSS and LCI-100C IMU.

Base stations were set by acquisition staff and were used to support the LiDAR data acquisition. The GNSS base station operated during the Lidar acquisition missions is listed below:

Table 3.1: GNSS Base Station

Station (Name)	Latitude (DMS)	Longitude (DMS)	Ellipsoid Height (L1 Phase center) (Meters)
CDC1	37 42 2.18477	113 5 32.66306	1689.067
H00410	37 10 17.76005	113 5 9.92983	1112.798

UTCE	37 42 15.17476	113 5 12.50246	1705.460
UTHN	37 11 8.50150	113 17 55.20862	1013.600

LiDAR Data Processing

When the sensor calibration, data acquisition, and GPS processing phases were complete, the formal data reduction processes by Woolpert lidar specialists included:

- Processed individual flight lines to derive a raw “Point Cloud” LAS file. Matched overlapping flight lines, generated statistics for evaluation comparisons, and made the necessary adjustments to remove any residual systematic error.
- Calibrated LAS files were imported into the task order tiles and initially filtered to create a ground and non-ground class. Then additional classes were filtered as necessary to meet client specified classes.
- Once all project data was imported and classified, survey ground control data was imported and calculated for an accuracy assessment. As a QC measure, Woolpert has developed a routine to generate accuracy statistical reports by comparisons against the TIN and the DEM using surveyed ground control of higher accuracy. The lidar is adjusted accordingly to meet or exceed the vertical accuracy requirements.
- The lidar tiles were reviewed using a series of proprietary QA/QC procedures to ensure it fulfills the task order requirements. A portion of this requires a manual step to ensure anomalies have been removed from the ground class.
- The lidar LAS files are classified into the Default (Class 1), Ground (Class 2), Low Vegetation (Class3), Medium Vegetation (Class4), High Vegetation (Class 5), Low noise (Class 7), Bridge Decks (Class 17), High Noise (Class 18) classifications.
- Although hydro flattening was a requirement for this task order no hydro features satisfied the USGS LBS version 1.2 criteria for hydro collection. Bridge breaklines were also compiled in efforts to generate an accurate DEM product. The bridge breakline product was delivered in ESRI shapefile format and was also used in the processing of the DEM deliverable.
- FGDC Compliant metadata was developed for the task order in .xml format per product.
- The horizontal datum used for the task order was referenced to NAD83(2011) UTM12N meters. The vertical datum used for the task order was referenced to NAVD 1988, meters, GEOID12B.

Section 4: Accuracy Assessment

Final Vertical Accuracy Assessment

The vertical accuracy statistics were calculated by comparison of the LiDAR bare earth points to the ground surveyed QA/QC points.

Table 4.1: Overall Vertical Accuracy Statistics

Average error	+0.027	meter
Minimum error	-0.135	meter
Maximum error	+0.355	meter
Average magnitude	0.058	meter
Root mean square	0.080	meter
Standard deviation	0.075	meter

VERTICAL ACCURACY CONCLUSIONS

Raw Swath Non-Vegetated Vertical Accuracy (NVA) Tested 0.156 Meters Non vegetated vertical accuracy at a 95 percent confidence level, derived according to NSSDA, in open terrain using $(RMSE_z) \times 1.96000$ as defined by the National Standards for Spatial Data Accuracy (NSSDA); assessed and reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the TIN using all points.

LAS Swath Non-Vegetated Vertical Accuracy (NVA) Tested 0.123 Meters Non vegetated vertical accuracy at a 95 percent confidence level, derived according to NSSDA, in open terrain using $(RMSE_z) \times 1.96000$ as defined by the National Standards for Spatial Data Accuracy (NSSDA); assessed and reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the TIN using ground points.

VERTICAL ACCURACY CONCLUSIONS

Bare-Earth DEM Non-Vegetated Vertical Accuracy (NVA) Tested 0.152 Meters Non-Vegetated vertical accuracy at a 95 percent confidence level, derived according to NSSDA, in open terrain using $(RMSE_z) \times 1.96000$ as defined by the National Standards for Spatial Data Accuracy (NSSDA); assessed and reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the DEM.

Table 4.4: VVA Quality Check Point Analysis DEM

Vertical Accuracy Conclusions

Vegetated Vertical Accuracy (VVA) Tested 0.272 Meters at the 95th percentile reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the DEM. VVA Errors larger than 95th percentile include: Point 3009A, Easting 305965.463, Northing 4146299.16, Z-Error 0.275 Meters

Figure 4.1: LIDAR Relative Accuracy Histogram for Zion National Park QL1 and QL2 Lidar

Relative Accuracy Assessment and Conclusion

Relative accuracy also known as "between swath" accuracy was tested through a series of well distributed flight line overlap locations. The relative accuracy for the Zion National Park QL1 and QL2 Lidar measured at 0.051 feet RMSDz.

Section 5: LiDAR Acquisition Flight Logs

This section contains the Flight Log(s) covering the project. Flight Logs list mission specific details such as crew members, airports, weather conditions, real time PDOP values and document any issues encountered during the mission. Flight Logs are filled out by the sensor operator during the acquisition flight.

FLIGHT LOG

PROJECT NAME:	P2015.025 - Zion National Park			BASE AIRPORT:	Cedar City (CDC)
LOCATION / AREA:	Zion National Park, UT / Reflights			DATE:	07 July 2016
AIRCRAFT:	Cessna 401 - N6255Q			PILOT:	Ray L.
SYSTEM:	Dual DragonEye			OPERATOR:	Dushan A.
MISSION ID:	P2015-025-ZionNP_QL2R & QL1R			CLOUDS:	Clear
BASE STATION:	HO0410 & UTHN			WIND:	10-15 kts @ 220°
ENGINE START:	12:26	ENGINE OFF:	17:03	ENGINE TIME:	04:37
GNSS START:	12:29	GNSS START:	-		
TAKEOFF:	12:36	TOUCHDOWN:	17:00	AIR TIME	04:24
FL #	START TIME	END TIME	TOPO PRF PWR	BATHY PWR CHII	REMARKS
	12:52:00				Initialize over UTHN
	13:00:00				Dataset: QL2R_20160707_130334

Section 6: Final Deliverables

The final lidar deliverables are listed below.

- LAS v1.4 classified point cloud
- LAS v1.4 raw unclassified point cloud flight line strips.
- Bridge Breaklines as ESRI shapefile
- Digital Elevation Model in ERDAS .IMG format
- 8-bit intensity images in .TIF format
- Tile Index provided as ESRI shapefile
- Control Points provided as ESRI shapefile
- FGDC compliant metadata per product in XML format
- Lidar processing report in pdf format
- Survey report in pdf format
