

LiDAR Quality Assessment Report

The USGS National Geospatial Technical Operations Center, Data Operations Branch is responsible for conducting reviews of all Light Detection and Ranging (LiDAR) point-cloud data and derived products delivered by a data supplier before it is approved for inclusion in the National Elevation Dataset. The USGS recognizes the complexity of LiDAR collection and processing performed by the data suppliers and has developed this Quality Assessment (QA) procedure to accommodate USGS collection and processing specifications with flexibility. The goal of this process is to assure LiDAR data are of sufficient quality for database population and scientific analysis. Concerns regarding the assessment of these data should be directed to the Chief, Data Operations Branch, 1400 Independence Road, Rolla, Missouri 65401.

Project Materials Received

All project deliverables must be supplied according to collection and processing specifications. The USGS will postpone the QA process when any of the required deliverables are missing. When deliverables are missing, the Contracting Officer Technical Representative (COTR) will be contacted by the Elevation Section supervisor and informed of the problem. Processing will resume after the COTR has coordinated the deposition of remaining deliverables.

Vertical Accuracy Review Accepted

ASPRS recommends that checkpoint surveys be used to verify the vertical accuracy of LiDAR data sets. Checkpoints are to be collected by an independent survey firm licensed in the particular state(s) where the project is located. While subjective, checkpoints should be well distributed throughout the dataset. National Standards for Spatial Data Accuracy (NSSDA) guidance states that checkpoints may be distributed more densely in the vicinity of important features and more sparsely in areas that are of little or no interest. Checkpoints should be distributed so that points are spaced at intervals of at least ten percent of the diagonal distance across the dataset and at least twenty percent of the points are located in each quadrant of the dataset.

NSSDA and ASPRS require that a minimum of twenty checkpoints (thirty is preferred) are collected for each major land cover category represented in the LiDAR data. Checkpoints should be selected on flat terrain, or on uniformly sloping terrain in all directions from each checkpoint. They should not be selected near severe breaks in slope, such as bridge abutments, edges of roads, or near river bluffs. Checkpoints are an important component of the USGS QA process. There is the presumption that the checkpoint surveys are error free and the discrepancies are attributable to the LiDAR dataset supplied.

For this dataset, USGS checked the spatial distribution of checkpoints with an emphasis on the bare-earth (open terrain) points; the number of points per class; the methodology used to collect these points; and the relationship between the data supplier and checkpoint collector. When independent control data are available, USGS has incorporated this into the analysis.

Checkpoint Distribution Image

Based on this review, the USGS <u>accepts</u> the vertical accuracy.

End of Vertical Accuracy Review

Raw-Swath LiDAR Review Accepted

LAS swath files or raw unclassified LiDAR data are reviewed to assess the quality control used by the data supplier during collection. Furthermore, LAS swath data are checked for positional accuracy. The data supplier should have calculated the Non-Vegetated Vertical Accuracy using ground control checkpoints measured in clear open terrain (*see Vertical Accuracy Review Section*).

Review Required: • Yes No **RAW-SWATH LIDAR FILE CHARACTERISTICS** Separate folder for swath/raw LiDAR files

LAS Version: <u>1.4</u>

Point Record Format: <u>6</u> If specified, *.wpd files for full waveform data have been provided:<u>Select...</u> ✓ Correct and properly formatted georeference information is included in all LAS file headers ✓ Adjusted GPS time used with the global encoder id set to 1 Additional comments:

Based on this review, the USGS accepts the swath/raw LiDAR data.

End of Swath/Raw LiDAR Review

Tiled/Classified LiDAR Review Accepted

Classified LAS tile files are used to build digital terrain models using the points classified as ground. Therefore, it is important that the classified LAS are of sufficient quality to ensure that the derivative product accurately represents the landscape that was measured. Classified LAS Tiles are comprised as follows, "all project swaths, returns, and collected points, fully calibrated, adjusted to ground, and classified and cut, by tiles, excluding calibration swaths, cross-ties, and other swaths not used, or intended to be used, in product generation".

Review Required: 💽 Yes 🔘 No

CLASSIFIED LIDAR TILE CHARACTERISTICS

Separate folder for classified/tiled LiDAR files

LAS Version: <u>1.4</u>

Point Record Format: Select ...

If specified, *.wpd files for full waveform data have been provided: Select...

Classified LAS tile files conform to project tiling scheme

Quantity of classified LAS tile files conforms to project tiling scheme

Classified LAS tile files do not overlap

Classified LAS tile files are uniform in size

Correct and properly formatted georeference information is included in all LAS file headers

Adjusted GPS time used with the global encoder id set to 1

Classified LAS tile files have no points classified as '12' (Overlap) and correctly use overlap bit.

Point classifications are limited to the standard values listed bel

Code	Description	Used

Breaklines contain elevation values.		
Elevation values stored in Geometery (ZEnabled)		
Units: <u>Meters</u>		
☑ Waterbody Breaklines.		
Polyline 🗌 Polygon 🔽		
Single elevation value per waterbody feature.		
Required.		
Waterbody Elevations were created via Select	waterbody level techniques.	
Double Line Stream Breaklines (Streams Approximately	/ > 100 ft).	

Single Line Breaklines.

✓ No missing or misplaced breaklines.

Based on this review, the USGS accepts the breakline files.

End of Breakline Review

DEM Review Accepted

The derived bare-earth file(s) receive a review of the vertical accuracies provided by the data supplier, vertical accuracies calculated by the USGS using supplied and independent checkpoints (*see the prior Vertical Accuracy Review Section*), and a thorough visual review for any anomalies or inconsistencies in assessing the quality of the DEM(s).

BARE-EARTH DEM TILE CHARACTERISTICS:

Separate folder for bare-earth DEM files

Raster File Type: IMG

Raster Cell Size: 1 Meters

Tile bit depth/pixel Type: Select or type...

Interpolation or Resampling Technique: Proprietary

✓ DEM tiles do not overlap

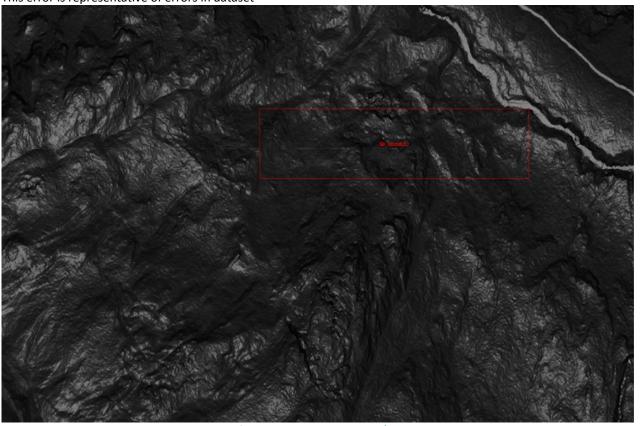

✓ DEM tiles conform to Project Tiling Scheme

☑ Quantity of DEM files conforms to Project Tiling Scheme

✓ DEM tiles are uniform in size

DEM tiles properly edge match and free of edge artifacts

Tile mismatch3, tiles are not edge matched properly. This error is representative of errors in dataset

Response to call is the error is due to the software we are viewing in 5/23

✓ Tiles are free from Spikes and Pits

- ✓ Tiles are free from Data Holidays (*voids due to processing or collection errors*)
- ✓ Tiles do not exhibit systematic sensor error or cornrowing

Hydro Treatment: hydro-flattened

DEM tiles are properly Hydro Flattened \odot Yes \bigcirc No

✓ Waterbodies ² Acres or greater are flattened

Streams 100 ft. or greater are flattened in a downstream manner

- ✓ Tidal Boundaries/Shorelines are flattened
- ✓ No missing islands ¹ Acre or larger
- ☑ Bridges/Overpasses are properly removed
- ✓ Culverts are maintained (Not Hydro Enforced)
- ✓ Depressions, Sinks, are not filled in (Not Hydro Conditioned)
- ✓ Vegetation properly removed
- ✓ Manmade structures properly removed

Tiles recommended for NED 1/3rd:Yes.No.Tiles recommended for NED 1/9th:Yes.No.Tiles recommended for NED 1 Meter:Yes.No.LAS dataset recommended for distribution:tile classified

Based on this review, the USGS <u>accepts</u> the DEM tiles.

End of DEM Review

Based on this review, the provided delivery <u>Meets</u> the Contract and/or Task Order requirements. Additional Comments:
