

LiDAR Quality Assessment Report

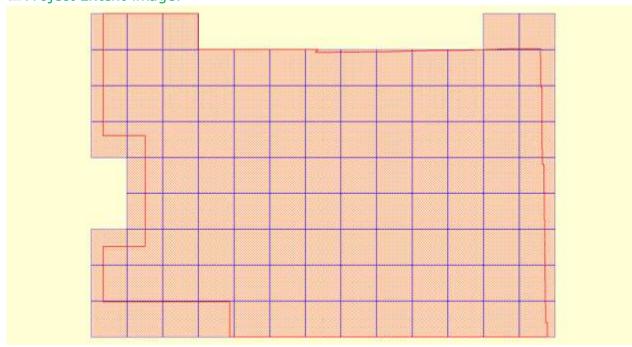

The USGS National Geospatial Technical Operations Center, Data Operations Branch is responsible for conducting reviews of all Light Detection and Ranging (LiDAR) pointcloud data and derived products delivered by a data supplier before it is approved for inclusion in the National Elevation Dataset and the Center for LiDAR Information Coordination and Knowledge. The USGS recognizes the complexity of LiDAR collection and processing performed by the data suppliers and has developed this Quality Assessment (QA) procedure to accommodate USGS collection and processing specifications with flexibility. The goal of this process is to assure LiDAR data are of sufficient quality for database population and scientific analysis. Concerns regarding the assessment of these data should be directed to the Chief, Data Operations Branch, 1400 Independence Road, Rolla, Missouri 65401 or NGTOCoperations@usgs.gov.

Materials Received: 7/25/2012	Project Type: Partnership W/O Agreement
	Project Description:
Project ID: MO_Adair_2012	Adair Co is part of the Missouri Grand 2011 LiDAR dataset. The St. Louis
Project Alias(es):	District of the United States Army Corps of Engineers (USACE) contracted with Surdex Corporation in the fall of 2011 to collect high resolution LiDAR elevation data over multiple counties as part of the Missouri Grand Counties Lidar Project. This project consists of 4 delivery blocks including all or part of Howard, Cooper, Montgomery, Livingston, Randolph, Monroe, Audrain, Lincoln, Macon, Adair, Sullivan, Putnam, and St. Louis City and County. There is additional coverage within Ray, Gasconade, St. Francois and Jackson Counties. The project combines the varied interests of the NRCS, USGS, USACE and State Emergency Management Agency (SEMA) totaling over 6287 square miles into a unified collection and processing project to benefit the US Government. The NRCS shall serve as the technical point of contact with the USACE St Louis District. This QA report covers Adair Co and is part of delivery block 2

Project Deliverables

All project deliverables must be supplied according to collection and processing specifications. The USGS will postpone the QA process when any of the required deliverables are missing. When deliverables are missing, the Contracting Officer Technical Representative (COTR) will be contacted by the Elevation/Orthoimagery Section supervisor and informed of the problem. Processing will resume after the COTR has coordinated the deposition of remaining deliverables.

Review Cycle

This section documents who performed the QA Review on a project as well as when QA reviews were started, actions passed, received, and completed.

Reviewer:	Review Start Date:	
L. Lansbery/S.Ruhl	10/22/2012	
Action to Contractor Date	Issue Description	Return Date
11/28/2012	No action required on DEM	

Review Complete: 5/23/2013

Metadata Review

Provided metadata files have been parsed using 'mp' metadata parser. Any errors generated by the parser are documented below for reference and/or corrective action.

The Project XML Metadata file parsed <u>without</u>errors.

The Swath LAS XML Metadata file parsed <u>without</u>errors.

The Classified LAS XML Metadata file parsed withouterrors.

The Breakline XML Metadata file parsed without errors.

The Bare-Earth DEM XML Metadata file parsed <u>without</u>errors.

7 QA Form V1.1 24AUG11

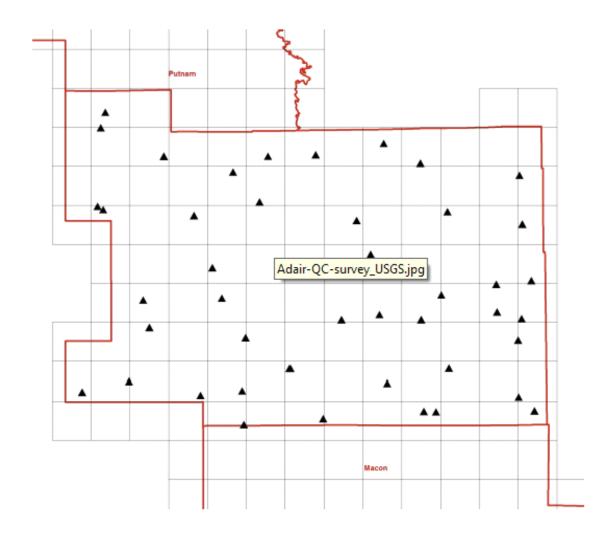

Project QA/QC Report Review

ASPRS recommends that checkpoint surveys be used to verify the vertical accuracy of LiDAR data sets. Checkpoints are to be collected by an independent survey firm licensed in the particular state(s) where the project is located. While subjective, checkpoints should be well distributed throughout the dataset. National Standards for Spatial Data Accuracy (NSSDA) guidance states that checkpoints may be distributed more densely in the vicinity of important features and more sparsely in areas that are of little or no interest. Checkpoints should be distributed so that points are spaced at intervals of at least ten percent of the diagonal distance across the dataset.

NSSDA and ASPRS require that a minimum of twenty checkpoints (thirty is preferred) are collected for each major land cover category represented in the LiDAR data. Checkpoints should be selected on flat terrain, or on uniformly sloping terrain in all directions from each checkpoint. They should not be selected near severe breaks in slope, such as bridge abutments, edges of roads, or near river bluffs. Checkpoints are an important component of the USGS QA process. There is the presumption that the checkpoint surveys are error free and the discrepancies are attributable to the LiDAR dataset supplied.

For this dataset, USGS checked the spatial distribution of checkpoints with an emphasis on the bare-earth (open terrain) points; the number of points per class; the methodology used to collect these points; and the relationship between the data supplier and checkpoint collector. When independent control data are available, USGS has incorporated this into the analysis.

Checkpoint Shapefile or Geodatabase: ☑ Checkpoint Distribution Image?

The following land cover classes are represented in this dataset (uncheck any that do not apply):

- 🗹 Bare Earth
- ☑ Tall Weeds and Crops
- $\hfill\square$ Brush Lands and Low Trees
- ☑ Forested Areas Fully Covered by Trees
- □ Urban Areas with Dense Man-Made Structures

There are a minimum of 20 checkpoints for each land cover class represented. Points within each class are uniformly distributed throughout the dataset. USGS <u>was not</u>able to locate independent checkpoints for this analysis. USGS <u>accepts</u> the quality of the checkpoint data for these LiDAR datasets.

● Yes ○ No

Image?	
NGTOC vertical accuracy test results are exactly the same as the reported results. I is suspect that the points are not truly blind points.	t

Accuracy values are reported in terms of Fundamental Vertical Accuracy (FVA), Supplemental Vertical Accuracy(s) (SVA), and Consolidated Vertical Accuracy (CVA).

Accuracy values are reported in: centimeters

Required FVA Value is 24.5 centimeters or less.

Target SVA Value is 36.3 centimeters or less.

Required CVA Value is 36.3 centimeters or less.

The reported FVA of the LAS Swath data is 19.6 centimeters.

The reported FVA of the Bare-Earth DEM data is 23.4 centimeters .

SVA are required for each land cover type present in the data set with the exception of bare-earth. SVA is calculated and reported as a 95th Percentile Error.

Land Cover Type	SVA Value	Units
Tall Weeds and Crops	19.4	centimeters
Brush Lands and Low Trees		centimeters
Forested Areas Fully Covered by Trees	19.9	centimeters
Urban Areas with Dense Man-Made Structu		centimeters

The reported CVA of this data set is: 19.9 centimeters .

LAS Swath File Review

LAS swath files or raw unclassified LiDAR data are reviewed to assess the quality control used by the data supplier during collection. Furthermore, LAS swath data are checked for positional accuracy. The data supplier should have calculated the Fundamental Vertical Accuracy using ground control checkpoints measured in clear open terrain. The following was determined for LAS swath data for this project:

LAS Version • LAS 1.2
• LAS 1.3
• LAS 1.4

Swath File Characteristics

- Separate folder for LAS swath files
- ✓ Each swath files <= 2GB</p>
- \square *If specified, *.wdp files for full waveform have been provided

The reported FVA of the LAS swath data is 19.6 centimeters.

Based on this review, the USGS does not accept at this time the LAS swath file data.

• Yes • No

LIDAR Data Planning and Acquisition:

The following parameters were used in preparing the flight plan.

Flight altitude	6,847' AMSL	
Airspeed	150 knots	
Full swath width	1162 meters	
Overlap between strips	20 % (average)	
Field of View	34.0 degrees	
Average Point Spacing	0.86 meters	
Scan frequency	49.0 Hz	
Pulse Repetition Rate	121,300 Hz	
Returns per pulse	4 + intensity	

Swath FVA tested 22.6cm @ NGTOC.

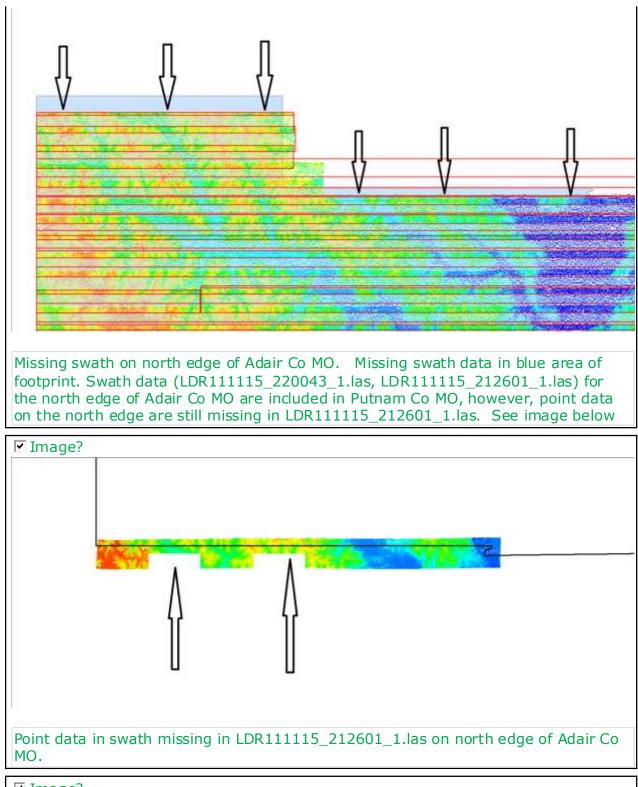

Scan angle seems excessively wide. Min Scan Angle (SAMN) = -48. Max Scan Angle (SAMX) = 44.

In the Project Overview section, pg. 2 of 5, of the "LiDAR Acquisition Processing Summary" the table shown above specifies parameters used in preparing the flight plan for Adair Co. Field of View (FOV) of 34 degrees. The Min (SAMN) and Max (SAMX) Scan Angle should not exceed + or - 17 degrees from Nadir. Scan Angles extremely exceed these parameters. The scan angles reported in LP360, -48 and 44, exceed Leica ALS- 50 II system accuracy limits of 75 degrees (FOV) + or - 37.5 degrees from Nadir.

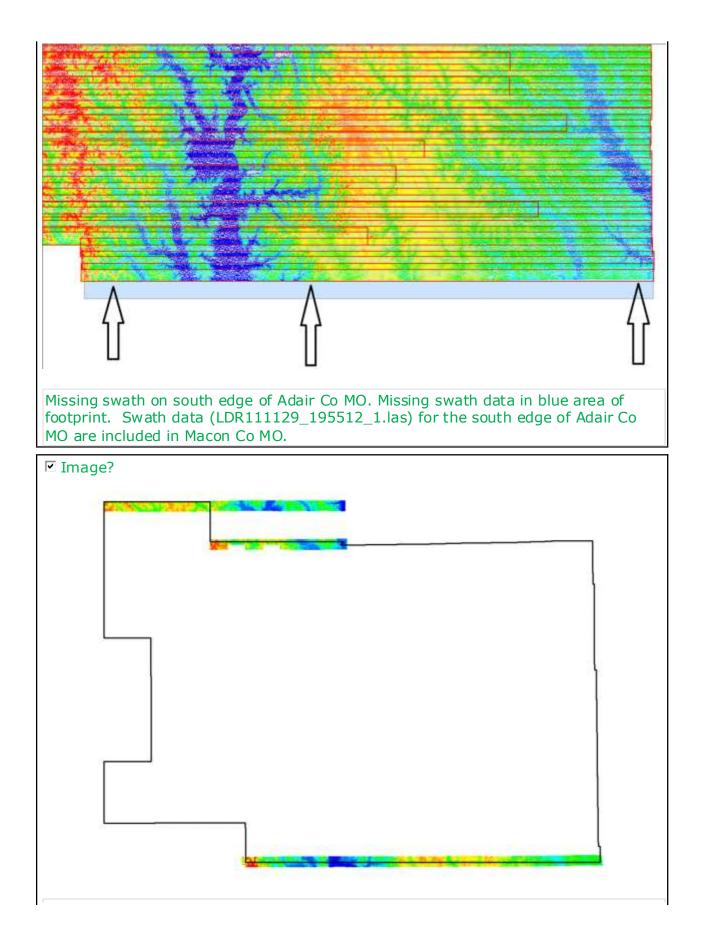

Accuracy testing supports the data and it is the opinion of NGTOC that the data is correct and the scan angles have been recorded in error. Please explain why scan angle exceeds FOV in the project flight plan and the Leica ALS-50 II capabilities.

Note Flying altitude is always referred to as Above Ground Level (AGL) not Above Mean Sea Level (AMSL)

LAS Tile File Review

Classified LAS tile files are used to build digital terrain models using the points classified as ground. Therefore, it is important that the classified LAS are of sufficient quality to ensure that the derivative product accurately represents the landscape that was measured. The following was determined for classified LAS files for this project:

Classified LAS Tile File Characteristics

- Separate folder for Classified LAS tile files
- Classified LAS tile files conform to Project Tiling Scheme
- ☑ Quantity of Classified LAS tile files conforms to Project Tiling Scheme
- Classified LAS tile files do not overlap
- Classified LAS tile files are uniform in size
- Classified LAS tile files have no points classified as '12'
- Point classifications are limited to the standard values listed below:

Code	Description					
1	Processed, but unclassified					
2	Bare-earth ground					
7	Noise (low or high, manually identified, if needed)					
9	Water					
10	Ignored ground (breakline proximity)					
11	Withheld (if the "Withheld" bit is not implemented in processing software)					

□ Buy up?

Based on this review, the USGS <u>accepts</u> the classified LAS tile file data.

• Yes • No

□ Image?

Scan angle seems excessively wide. Min Scan Angle (SAMN) = -48. Max Scan Angle (SAMX) = 44.

Note

In the Project Overview section, pg. 2 of 5, of the "LiDAR Acquisition Processing Summary" the table shown specifies parameters used in preparing the flight plan for Adair Co. Field of View (FOV) of 34 degrees. The Min (SAMN) and Max (SAMX) Scan Angle should not exceed + or - 17 degrees from Nadir. Scan Angles extremely exceed these parameters. The above listed scan angles, -48 and 44, exceed Leica ALS- 50 II system accuracy limits of 75 degrees (FOV) + or - 37.5 degrees from Nadir.

Accuracy testing supports the data and it is the opinion of NGTOC that the data is correct and the scan angles have been recorded in error. Please explain why scan angle exceeds FOV in the project flight plan and the Leica ALS-50 II capabilities.

Note Flight altitude is always referred to as Above Ground Level (AGL) not Above Mean Sea Level (AMSL)

Breakline File Review

Breaklines are vector feature classes that are used to hydro-flatten the bare earth Digital Elevation Models.

Breakline File Characteristics

- Separate folder for breakline files
- All breaklines captured as PolylineZ or PolygonZ features
- ☑ No missing or misplaced breaklines

Based on this review, the USGS <u>accepts</u> the breakline files.

Errors, Anomalies, Other Issues to document? O Yes
No

Bare-Earth DEM Tile File Review

The derived bare-earth DEM file receives a review of the vertical accuracies provided by the data supplier, vertical accuracies calculated by USGS using supplied and independent checkpoints, and a manual check of the appearance of the DEM layer.

Bare-Earth DEM files provided in the following format: ArcGrid

Bare-Earth DEM Tile File Characteristics

- ☑ Separate folder for bare-earth DEM files
- DEM files conform to Project Tiling Scheme
- Quantity of DEM files conforms to Project Tiling Scheme
- ☑ DEM files do not overlap
- ☑ DEM files are uniform in size
- DEM files properly edge match
- ☑ Independent check points are well distributed

All accuracy values reported in centimeters

Reported Accuracies				
Land Cover Category	# of Points	$\frac{\text{Fundamental}}{\text{Vertical Accuracy}}$ $\frac{@95\%}{\text{Confidence}}$ Interval (Accuracy_{z}) $\text{Required FVA} = 24.5$ or less.	Supplemental Vertical Accuracy @95th Percentile Error Target SVA = 36.3 or less.	<u>Consolidated</u> <u>Vertical Accuracy</u> @95th Percentile Error Required CVA = 36.3 or less.
Open Terrain	31	23.4		
Tall Weeds and Crops	34		19.4	
Brush Lands and Low Trees				
Forested Areas Fully Covered by Trees	30		19.9	
<i>Urban Areas with Dense</i> <i>Man-Made Structures</i>				
Consolidated	95			19.9

Reported Accuracies

☑ QA performed Accuracy Calculations?

Calculated Accuracies

Land Cover Category	# of Points	FundamentalVertical Accuracy@95%ConfidenceInterval(Accuracy(AccuracyRequired FVA =24.5or less.	Supplemental Vertical Accuracy @95th Percentile Error Target SVA = 36.3 or less.	<u>Consolidated</u> <u>Vertical Accuracy</u> @95th Percentile Error Required CVA = 36.3 or less.
