Section 1: Overview

TASK ORDER NAME: CO San Juan 2017 D17

Project: # 77866

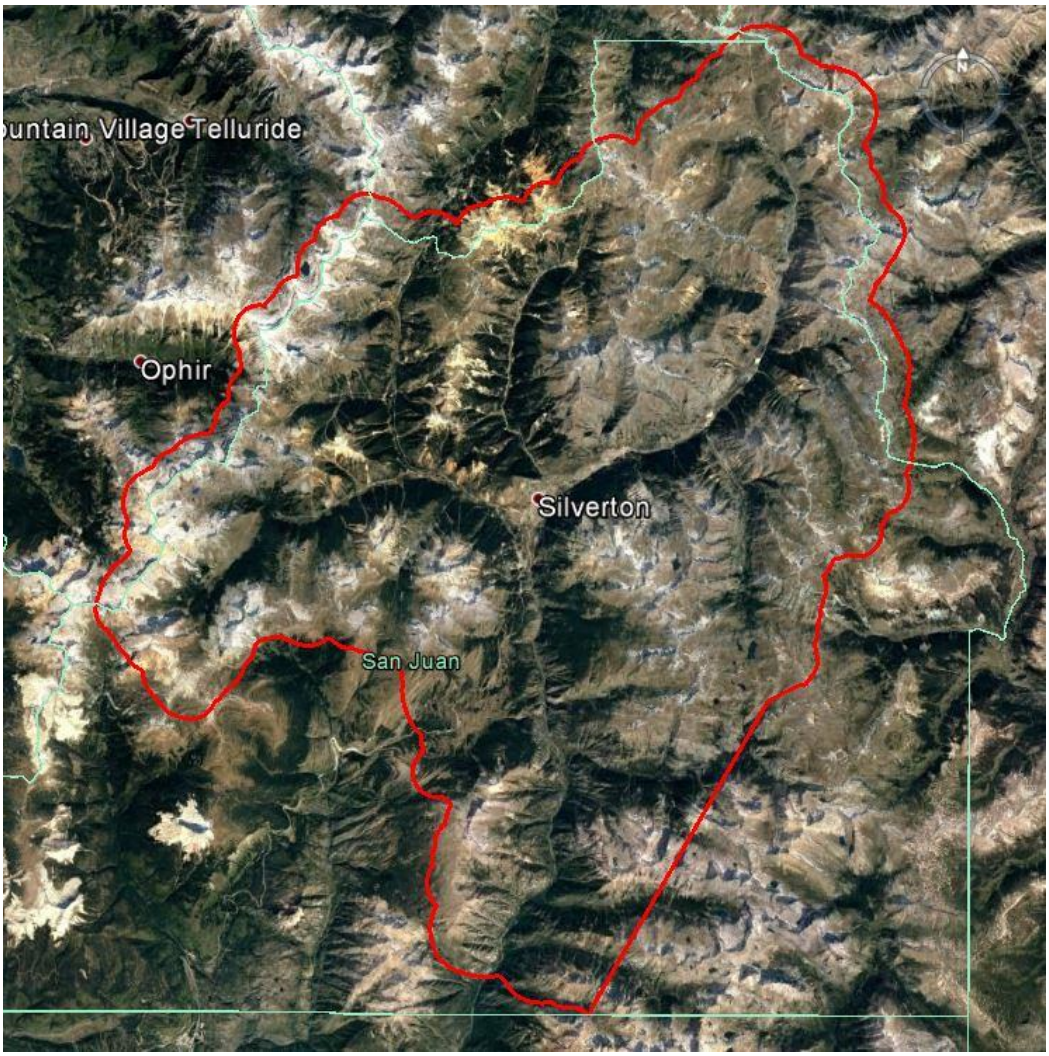
This report contains a comprehensive outline of the CO San Juan 2017 D17 Lidar task order for the United States Geological Survey (USGS) issued under USGS Contract No. G16PC00022, Task Order No. G17PD01197. This task consists of lidar data acquisition, and processing over an area of highly varied and rugged terrain located in southwest Colorado (+/- 232 sq. mi) of USGS V.1.2 lidar. The data were acquired at a NPS of no greater than 0.35 meters.
The NPS assessment is made against single swath, first return data located within the geometrically usable center portion (typically ~90%) of each swath.

The data was collected using a single Optech Galaxy lidar sensor on board a Cessna 310Q aircraft. The Galaxy sensor collects up to eight returns per pulse, as well as intensity data, for the first three returns. If a fourth return was captured, the system does not record an associated intensity value. The aerial lidar was collected at the following sensor specifications:

Table 1.1: Optech Galaxy Specifications	
Post Spacing	0.35 m
AGL (Above Ground Level) average flying height	1,250 m
Average Ground Speed:	140 knots
Field of View (full)	28 degrees
Pulse Rate	500 kHz
Scan Rate	72 Hz
Side Lap	40%

The horizontal datum used for the task order was referenced to NAD83 (2011), Zone 13, Meters. The vertical datum used for the task order was referenced to NAVD 1988 (GEOID12B), Meters.

Figure 1.1: CO San Juan 2017 D17 - Task Order AOI



Section 2: Acquisition

The lidar data was acquired with one Optech Galaxy lidar sensor system. The Galaxy lidar system, developed by Teledyne Optech of Vaughan, Ontario, Canada.

Table 2.1: Galaxy Lidar System Specifications

Parameter	Specification
Sensor Performance	
Performance envelope [1, 2, 3, 4]	150-4700 m AGL, nominal
Absolute horizontal accuracy [2, 3]	1/10,000 x altitude; 1 σ
Absolute elevation accuracy [2, 3]	< 0.03-0.20 m RMSE from 150-4700 m A
Laser Configuration	
Topographic laser	1064-nm near-infrared
Laser classification	Class IV (US FDA 21 CFR 1040.10 and 1040.11; IEC/EN 60825-1)
Pulse repetition frequency (effective)	Programmable, 50-1000 kHz
Beam divergence	0.25 mrad (1/e)
Laser range precision [5]	< 0.008 m, 1 σ
Minimum target separation distance	< 0.7 m (discrete)
Range capture	Up to 8 range measurements, including last
Intensity capture	Up to 8 intensity measurements, including last (12-bit)
Sensor Configuration	
Position and orientation system	POS AV™ AP60 (OEM); 220-channel dual frequency GNSS receiver; GNSS airborne antenna with Iridium filters; high-accuracy AIMU (Type 57); non-ITAR
Scan angle (FOV)	10-60°
Swath width	10-115% of altitude AGL
Scan frequency	0-120 Hz advertised (0-240 scan lines/sec)
Scan product	2000 maximum
Flight management system	Optech FMS (Airborne Mission Manager and Nav) with operator console
SwathTRAK™	Dynamic FOV for fixed-width data swaths in variable terrain
PulseTRAK™	Multipulse tracking algorithm with no density loss across PIA transition zones
Roll compensation	±5° minimum
Data storage	Internal solid-state drive (SSD)
Power requirements	28 V; 300 W
Dimensions and weight	Sensor: 0.34 x 0.34 x 0.25 m, 27 kg — PDU: 0.42 x 0.33 x 0.10 m, 6.5 kg
Operating temperature	0 to +35°C

Prior to mobilizing to the project site, flight crews coordinated with the necessary Air Traffic Control personnel to ensure airspace access. Crews were onsite, operating a Global Navigation Satellite System (GNSS) Base Station for the airborne GPS support.

The lidar data was collected in 12 (twelve) missions. An initial quality control process was performed immediately on the lidar data to review the data coverage, airborne GPS data, and trajectory solution. Collection of lidar data took place between September 16, 2017 and October 24, 2017.

Table 2.3: Airborne Lidar Acquisition Flight Summary

Date of Acquisition	Lines Flown	Acquisition Time (UTC)
September 16, 2017_A	**42, 43**	**1:58 – 2:25**
September 17, 2017_A	**36, 37, 40, 41**	**13:48 – 14:50**
September 18, 2017_A	**1, 2**	**13:48 – 14:05**
September 18, 2017_B	**39**	**2:09 – 2:26**
September 19, 2017_A	**34, 35, 38, 45, 69-81**	**15:35 – 18:29**
September 20, 2017_A	**1-8, 51-68**	**13:23 – 17:30**
September 20, 2017_B	**9-17**	**23:56 – 1:49**
September 21, 2017_A	**32, 33, 37, 41, 42, 44-50**	**14:13 – 17:07**
September 25, 2017_A	**18-31**	**18:42 – 21:42**
September 26, 2017_A	**82-91**	**16:41 – 17:49**
October 8, 2017_A	**96-106**	**17:09 – 18:12**
October 24, 2017_A	**1-12**	**15:34 – 17:19**

Section 3: Lidar Data Processing

Applications and Work Flow Overview

Raw lidar data is imported into LMS 4.1 as well as the processed SBET. The final output coordinate system is chosen. The correct .las format is then selected. The data is processed thru a standard process and then a refined process, which incorporates a bundle adjustment to the entire block of data. Once complete, the data is imported into the MARS8 software. A DZ ortho is produced to verify that flight line to flight line separation is meeting specifications and also to make sure there are no data gaps. Ground control points are then imported and a check point report is produced. Once all ground control points are meeting spec, a ground control point report is exported.

Global Navigation Satellite System (GNSS)–Inertial Measurement Unit (IMU) Trajectory Processing

Equipment

The pilots are skilled at maintaining their planned trajectory, while holding the aircraft steady and level. If atmospheric conditions are such that the trajectory, ground speed, roll, pitch and/or heading cannot be properly maintained, the mission is aborted until suitable conditions occur.

Base stations were set by acquisition staff and were used to support the Lidar data acquisition. The GNSS base station operated during the Lidar acquisition missions is listed below:

Table 3.1: GNSS Base Station

Station (Name)	Latitude (DMS)	Longitude (DMS)	Ellipsoid Height (L1 Phase center) (Meters)
DP6610	37° 57’ 13.23328 "	107° 54’ 16.62412 "	2740.490
HL0671	37° 09’ 31.83433"	107° 45’ 10.11433"	2014.163

Data Processing

GPS and IMU processing is done using POSPac MMS 8.0 software. The raw POS data is imported and the correct type of antenna is selected. The base station data is imported and the coordinates are modified to either an OPUS solution or an NGS datasheet. The correct antenna type and height are inputted. The coordinate system in which the base station data coordinates were inputted is chosen (ie NAD83 2011 or ITRF). The data is then processed in the "IN-Fusion Single Base" mode. The display plots are then reviewed for spec/quality criteria.

LiDAR Data Processing

When the sensor calibration, data acquisition, and GPS processing phases were complete, the formal data reduction processes by Woolpert lidar specialists included:

- Calibrated LAS files were imported into the task order tiles and initially filtered to create a ground and non-ground class. Then additional classes were filtered as necessary to meet client specified classes.
- Once all project data was imported and classified, survey ground control data was imported and calculated for an accuracy assessment. As a QC measure, Woolpert has developed a routine to generate accuracy statistical reports by comparisons against the TIN and the DEM using surveyed ground control of higher accuracy. The lidar is adjusted accordingly to meet or exceed the vertical accuracy requirements.
- The lidar tiles were reviewed using a series of proprietary QA/QC procedures to ensure it fulfills the task order requirements. A portion of this requires a manual step to ensure anomalies have been removed from the ground class.
- The lidar LAS files are classified into the Default/Processed but not classified (Class 1), Bare earth ground (Class 2), Low Noise (Class 7), Water (Class 9), Ignored ground (Class10), Bridge Decks (Class 17), and High Noise (Class 18) classifications.
- FGDC CSDGM USGS MetaParser-compliant metadata was developed for the task order in .xml format per product.
- The horizontal datum used for the task order was referenced to NAD83 (2011), Zone 13, Meters. The vertical datum used for the task order was referenced to NAVD 1988 (GEOID12B), Meters.

Section 4: Hydrologic Flattening

HYDROLOGIC FLATTENING OF LIDAR DEM DATA

The CO San Juan 2017 D17 lidar processing task order required the compilation of breaklines defining water bodies and rivers. The breaklines were used to perform the hydrologic flattening of water bodies, and gradient hydrologic flattening of double line streams and rivers. Lakes, reservoirs and ponds, at a minimum size of 2-acre or greater, were compiled as closed polygons. The closed water bodies were collected at a constant elevation. Rivers and streams, at a nominal minimum width of 30 meters (100 feet), were compiled in the direction of flow with both sides of the stream maintaining an equal gradient elevation.

LIDAR DATA REVIEW AND PROCESSING

Woolpert utilized the following steps to hydrologically flatten the water bodies and for gradient hydrologic flattening of the double line streams within the existing lidar data.

1. Woolpert used the newly acquired lidar data to manually draw the hydrologic features in a 2D environment using the lidar intensity and bare earth surface. Open Source imagery was used as reference when necessary.
2. Woolpert utilizes an integrated software approach to combine the lidar data and 2D breaklines. This process “drapes” the 2D breaklines onto the 3D lidar surface model to assign an elevation. A monotonic process is performed to ensure the streams are consistently flowing in a gradient manner. A secondary step within the program verifies an equally matching elevation of both stream edges. The breaklines that characterize the closed water bodies are draped onto the 3D lidar surface and assigned a constant elevation at or just below ground elevation.
3. The lakes, reservoirs and ponds, at a minimum size of 2-acre or greater and streams at a minimum size of 30 meters (100 feet) nominal width, were compiled to meet task order requirements. **Figure 4.1** illustrates an example of 30 meters (100 feet) nominal streams identified and defined with hydrologic breaklines. The breaklines defining rivers and streams, at a nominal minimum width of 30 meters (100 feet), were draped with both sides of the stream maintaining an equal gradient elevation.
4. All ground points were reclassified from inside the hydrologic feature polygons to water, class nine (9).
5. All ground points were reclassified from within a buffer along the hydrologic feature breaklines to buffered ground, class ten (10).
6. The lidar ground points and hydrologic feature breaklines were used to generate a new digital elevation model (DEM).

Figure 4.1: Example Hydrologic Breaklines

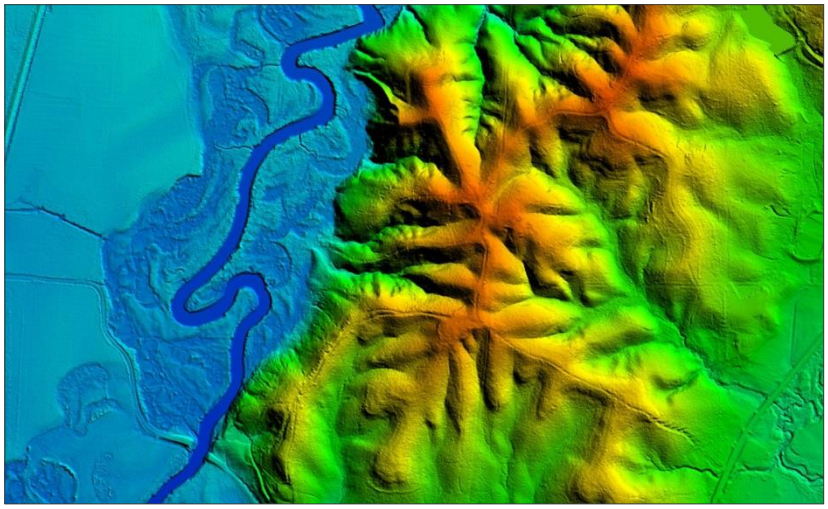


Figure 4.2: Reflects a DEM generated from original lidar bare earth point data prior to the hydrologic flattening process. Note the “tinning” across the lake surface.

Figure 4.3: Reflects a DEM generated from lidar with breaklines compiled to define the hydrologic features. This figure illustrates the results of adding the breaklines to hydrologically flatten the DEM data. Note the smooth appearance of the lake surface in the DEM.

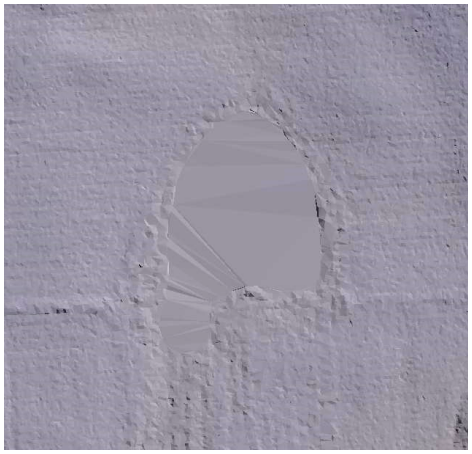

Figure 4.2

Figure 4.3

Terrascan was used to add the hydrologic breakline vertices and export the lattice models. The hydrologically flattened DEM data was provided to USGS in ERDAS IMG format.

The hydrologic breaklines compiled as part of the flattening process were provided to the USGS in Esri GDB format. The breaklines defining the water bodies greater than 2-acre were provided in shapefile format as Polygon-Z shapefiles. No rivers and streams, at a nominal minimum width of 30 meters (100 feet), were found.

DATA QA/QC

Initial QA/QC for this task order was performed in Global Mapper v17, by reviewing the grids and hydrologic breakline features. Additionally, Esri software and proprietary methods were used to review the overall connectivity of the hydrologic breaklines.

Edits and corrections were addressed individually by tile. If a water body breakline needed to be adjusted to improve the flattening of the DEM data, the area was cross referenced by tile number, corrected accordingly, a new DEM file was regenerated and reviewed.

Section 5: ACCURACY ASSESSMENT

Accuracy Assessment:

The vertical accuracy statistics were calculated by comparison of all lidar points to the ground surveyed QC points.

Table 5.1: Overall Vertical Accuracy Statistics		
Average error	-0.018	Meter
Minimum error	-0.111	Meter
Maximum error	0.116	Meter
Average magnitude	0.038	Meter
Root mean square	0.049	Meter
Standard deviation	0.046	Meter

VERTICAL ACCURACY CONCLUSIONS

Bare-Earth DEM Non-Vegetated Vertical Accuracy (NVA) Tested 0.120 Meters Non-Vegetated vertical accuracy at a 95 percent confidence level, derived according to NSSDA, in open terrain using 0.061 Meters (RMSEz) x 1.96000 as defined by the National Standards for Spatial Data Accuracy (NSSDA); assessed and reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the DEM against 45 NVA points.

Table 5.4: VVA Quality Check Point Analysis DEM

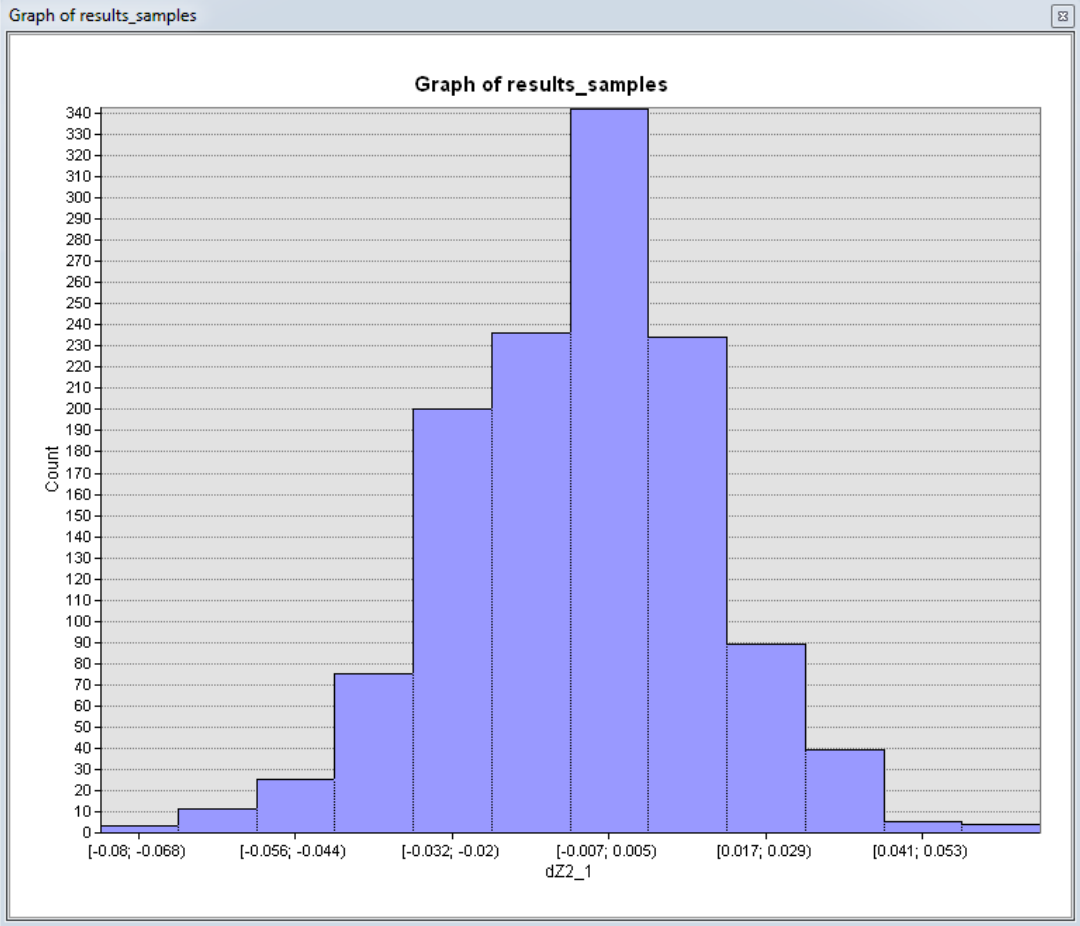
VERTICAL ACCURACY CONCLUSIONS

Vegetated Vertical Accuracy (VVA) Tested 0.257 Meters at the 95th percentile reported using National Digital Elevation Program (NDEP)/ASPRS Guidelines and tested against the DEM against 30 VVA points. VVA Errors larger than 95th percentile include:

Point 3010_A, Easting 267360, Northing 4198652, Z-Error 0.290 Meters

Figure 5.1: Lidar Relative Accuracy Histogram



RELATIVE ACCURACY ASSESSMENT AND CONCLUSION

Relative accuracy also known as "between swath" accuracy was tested through a series of well distributed flight line overlap locations. The relative accuracy for the lidar measured at 0.020 Meters RMSDz.

Approved by:	Name	Signature	Date
Associate Member, Lidar Specialist Certified Photogrammetrist #1381	Qian Xiao		May 2018

Section 6: Flight Logs

Section 7: Final Deliverables

The final lidar deliverables are listed below.

- Unclassified lidar point data swaths in LAS v1.4 format
- Classified point cloud data tiles in LAS v1.4 format
- Breaklines in Esri GDB
- 1-meter digital elevation model (DEM) tiles in ERDAS IMG format
- 1-meter, 8-bit gray-scale intensity image tiles in GeoTIF format
- Tile layout in Esri shapefile format
- Boundary in Esri shape file format
- Control and QA/QC checkpoints in Esri shapefile format
- Flight line boundaries in Esri shapefile format
- Task level FGDC compliant metadata in XML format
- Lidar processing report in PDF format
- Survey report in PDF format
