## **APPENDICES:**

1.	Project Network Control Monument Report.....	8-9
2.	Final Check Point Coordinates.....	10
3.	GPS Observation & Re-Observation Schedule.....	11
4.	Point Comparison Report.....	12
5.	Deliverables.....	Sent via Electronic Transfer Including: a) Ground Control Point Documentation Report – PID.pdf b) Final Coordinate List in Excel Format – ICP-Control.xls c) NGS Data Sheets for Project Controls – NGS Datasheets.pdf

# **1. INTRODUCTION**

## **1.1    *Project Summary***

Dewberry|Preble-Rish is under subcontract to Dewberry Consultants, LLC, to provide 50 Acquisition Ground Control Points that will be used to calibrate newly collected LiDAR and Imagery for the FL Panhandle QL2 LiDAR Project. Field survey was conducted from April 10 through 25, 2018.

Existing NGS Control Points were recovered and surveyed to verify the accuracy of the RTK/GPS survey equipment with the results shown in Section 2.4 and Appendix 1 of this report.

As an internal QA/QC procedure, and to verify that the LiDAR check points meet the 95% confidence level, all of the GCP survey points were re-surveyed and the differences between observations are shown in Appendix 4 of this report. An average of the two observations was computed to generate final coordinates and elevations.

Final horizontal coordinates are referenced to NAD 83 (2011), Universal Transverse Mercator (UTM) Zone 16, meters. Final vertical elevations are referenced to NAVD88 in Meters using Geoid model 2012B (Geoid12B).

## **1.2    *Points of Contact***

Questions regarding the technical aspects of this report should be addressed to:

### **Dewberry|Preble-Rish**

Frederick C. Rankin, P.S.M.  
Professional Surveyor & Mapper  
203 Aberdeen Parkway  
Panama City, Florida 32405  
(850) 522-0644 office  
(850) 522-1011 fax

### 1.3 Project Area

**FL PANHANDLE QL2 LIDAR PROJECT – GCP LOCATIONS**

## **2. PROJECT DETAILS**

### **2.1    *Survey Equipment***

In performing the GPS observations, Spectra Precision Epoch 80 GNSS RTK GPS receiver/antenna attached to a 6.56 foot (2 meter) fixed height pole was used, together with a Spectra Precision Ranger Data Collector equipped with SurveyPro Software (version 5.5.2), to collect GPS raw data for the field surveys.

### **2.2    *Survey Point Detail***

50 LiDAR calibration points were distributed throughout the project area. Approximate locations were provided to Dewberry|Preble-Rish prior to field survey.

A sketch was made for each location and a nail was set at the point where possible, unless said point was already located at a photo identifiable point. The LiDAR calibration point locations are detailed on the “Ground Control Point Documentation Report”, which is delivered via electronic transfer, see appendix 5a on sheet 2.

### **2.3    *Network Design***

The GPS survey performed by Dewberry|Preble-Rish was tied to the Trimble VRS Now Permanent Reference Network, a Real Time Network (RTN) managed by the Trimble Company. The Trimble VRS Now Network provides instant access to real-time kinematic (RTK) corrections utilizing a network of continuously operating permanent reference stations located throughout the United States, Europe, and Australia. Each site provides Global Positioning System (GPS) carrier phase and code range measurements in support of 3-dimensional positioning activities through Florida and surrounding states. All of the reference stations have been linked together, creating a Virtual Reference Station System (VRS).

## **2.4 Field Survey Procedures and Analysis**

Dewberry|Preble-Rish field surveyors used Spectra Precision Epoch 80 GNSS RTK GPS systems, which is a geodetic quality dual frequency GPS receiver, to collect data at each check point location.

A total of eleven (11) existing NGS monuments were located as an additional QA/QC procedure, for the purpose of verifying the accuracy of the VRS network. All NGS monuments used are published in the NSRS database, and represent the primary project control for this survey. Field GPS observations are detailed in the “Project Network Control Monument Report”, see appendix 1 on sheets 8-9.

All of the GCP check point locations were occupied twice. If re-observations matched the initially derived station positions within the allowable tolerance of  $\pm 5\text{cm}$  or within the 95% confidence level, then no further occupations were performed. If re-observations did not match the initially derived positions, a static GPS session was collected and processed through NOAA’s Online Positioning User Service (OPUS). Each VRS occupation utilized the Trimble VRS Now Network, was occupied for approximately 3 to 6 minutes in duration, and measured to 180 - 360 epochs. All static sessions were occupied for a minimum of 45 minutes, and up to 100 minutes. Field GPS observations are detailed in the “Ground Control Point Documentation Report”, and delivered via electronic transfer, see appendix 5a on sheet 2.

## **2.5 Adjustment**

Most survey data was collected using Virtual Reference Stations (VRS) methodology within a Virtual Reference System (VRS). The system is designed to provide a true Network RTK performance. The RTK software enables high-accuracy positioning in real time across a geographic region. The RTK software package uses real-time data streams from the GPS system user and generates correction models for high-accuracy RTK GPS corrections throughout the network. Therefore, corrections were applied to the points as they were being collected, thus negating the need for a post process adjustment.

Some survey data was collected using Rapid Static GPS Surveying methodology. Rapid Static methodology is similar to conventional static GPS, except for the benefit of needing shorter occupation times due to shorter baselines, favorable satellite geometry, and minimal signal disturbances. Once data was collected, static sessions were processed through NOAA’s Online Positioning User Service (OPUS). This service provides simplified access to high-accuracy National Spatial Reference System (NSRS) coordinates and elevations. OPUS uses software which computes coordinates and elevations for NGS’ Continuously Operating Reference Station (CORS) network. The resulting positions are accurate and consistent with other National Spatial Reference System users.

## **2.6    *Data Processing Procedures***

After field data is collected (and processed through OPUS for static observations) the information is downloaded into the office software. Text files are created that show the point number, northing, easting, elevation, and description (PNEZD format) for each point surveyed. Points are then entered into a Microsoft Excel spreadsheet, which contains formulas for calculating differences between published and field survey data, as well as, comparing differences between points surveyed multiple times. This data is used to confirm point accuracy and precision.

After review of the point data, an “ASCII” or “txt” file (PNEZD format) is created, which is the industry standard. Point files are loaded into our CADD program (AutoCAD Civil 3D) to make a visual check of the point data (Pt. #, Coordinates, Elev. and Description). For check points that were surveyed twice, an average of the two observations was computed to generate final northings, eastings, and elevations. The data can now be imported into the final product.
