## Overview

The original purpose of this project was to develop a consistent and accurate surface elevation dataset derived from high-accuracy Light Detection and Ranging (LiDAR) technology for the USGS IL\_8County\_PlusChampaign\_2019\_B19 project Area. The AOI covered approximately 6,337 square miles in total and include the counties of Champaign, Jo Daviess, Stephenson, Carroll, Ogle, Whiteside, Lee, Rock Island, and Henry. Block 3 allows for an increase in the quality level of the areas over Jo Daviess, Stephenson, Carroll, Ogle, Whiteside, Lee, Rock Island, and Henry County (~5318 sq. mi.) of an ANPS $\leq$ 0.5m. Adverse ground conditions during the fall 2019 flight season limited Lidar acquisition to a small portion of the entire project area. Approximately 5318 square miles of Block 3 referred to as Block 3\_IL\_8\_County\_Lidar 2019 was acquired in the fall of 2019, spring and fall of 2020. During the times off collection the river level fluctuated.

The LiDAR data for Block 3 Illinois 8 County was processed and classified according to project specifications. Detailed breaklines, bare earth Digital Elevation Models (DEMs), and Intensity Images were produced for the Block 3 Project area. Data was formatted into tiles with each tile covering an area of 1000 meters by 1000 meters. A total of 14,482 LAS files, 14,482 DEMs, and 14,481 Intensity Images were produced for the project, encompassing the Block 3 AOI of approximately 5318 square miles and formatted into 14,482total tiles.

### PROJECT TEAM

Aerial Services, Inc. (ASI) served as the prime contractor for the project. In addition to project management ASI was responsible for LiDAR acquisition and calibration, LAS classification, LiDAR products, Digital Elevation Model (DEM) production, Intensity Image production, and quality assurance. Subcontractor: SurvTech was responsible for LiDAR acquisition and calibration, LAS classification and hydro collection for 1264 square mile area of the Southwest section of the project area. SurvTech manually preformed bare earth cleanup, and collected hydro for 759 of square miles of the project. Subcontractor: Tetra Tech manually preformed bare earth cleanup, and collected hydro for 1732 of square miles of the project. Subcontractor Dewberry manually preformed bare earth cleanup, and collected hydro for 1533 of square miles of the project. All follow-on processing was completed by the prime contractor.

Surveying and Mapping, LLC (SAM) completed ground surveying for the project and delivered surveyed checkpoints. SAM was to acquire surveyed checkpoints for the project to use in independent testing of the vertical accuracy of the LiDAR-derived surface model. Please see SURVEY REPORT to view the separate Survey Report that was created for this portion of the project.

### SURVEY AREA

The project area addressed by this report falls within the Block 3 Illinois 8 County, covering Jo Daviess, Stephenson, Carroll, Ogle, Whiteside, Lee, Rock Island, and Henry County, Illinois.

### DATE OF SURVEY

LiDAR acquisition for Block 3 Illinois 8 County was conducted between the dates of November 23, to December 7, 2019, with missions flown on March 8, 2020 and November 12, 2020 to fill in a data void.

## COORDINATE REFERENCE SYSTEM

Data produced for the project was delivered in the following reference system.

**Horizontal Datum:** The horizontal datum for the project is North American Datum of 1983 with the 2011 Adjustment (NAD 83 (2011)).

**Vertical Datum:** The Vertical datum for the project is North American Vertical Datum of 1988 (NAVD88).

**Coordinate System:** Albers Equal Area.

**Units:** Horizontal units are in meters, Vertical units are in meters.

**Geoid Model:** Geoid12B

## LIDAR VERTICAL ACCURACY

For the Block 3 IL 8 County project, the tested RMSE<sub>z</sub> of the classified LiDAR data for checkpoints in non-vegetated terrain equaled 0.055 meters compared with the 10 cm specification: The 95% confidence value of NVA of the classified LiDAR data computed using RMSE<sub>z</sub> x 1.96 and was found to equal 0.108 meters compared with the 0.196 meter specification.

For the Block 3 IL 8 County project, the tested VVA of the classified LiDAR data computed using the 95<sup>th</sup> percentile was equal to 0.053 meters, compared with the 0.294 meter (0.96 ft) specification.

This project must meet Non-vegetated Vertical Accuracy (NVA)  $\leq$  0.0196 meters (19.6 cm) at the 95% confidence level based on RMSE<sub>z</sub>  $\leq$  0.100 meters (10 cm) x 1.9600.

100 % of Totals	# of Points	RMSE <sub>z</sub> NVA (m)	NVA-Non-vegetated Vertical Accuracy ((RMSE <sub>z</sub> x 1.9600) m	Mean (m)	Median (m)	Skew	Std Dev (m)	Min (m)	Max (m)	Kurtosis
NVA	127	0.055	0.108	-0.034	-0.030	-0.108	0.044	-0.160	0.110	1.073

Table 1: Non-vegetated Vertical Accuracy (NVA) results.

Additional accuracy information and statistics for the classified LiDAR data, raw swath data, and bare earth DEM data can be found in following sections of this report.

## PROJECT DELIVERABLES

The deliverables for the project are listed below.

Classified Point Cloud Data (Tiled)

Bare Earth Surface (Raster DEM – IMG format)

Intensity Images (8-bit gray scale, tiled, GeoTIFF format)

Breakline Data (File GDB)

Independent Survey Checkpoint Data (File GDB)

Calibration Points (File GDB)

Metadata

Maximum surface height raster

Swath separation Images

Project Report (Acquisition, Processing, QC)

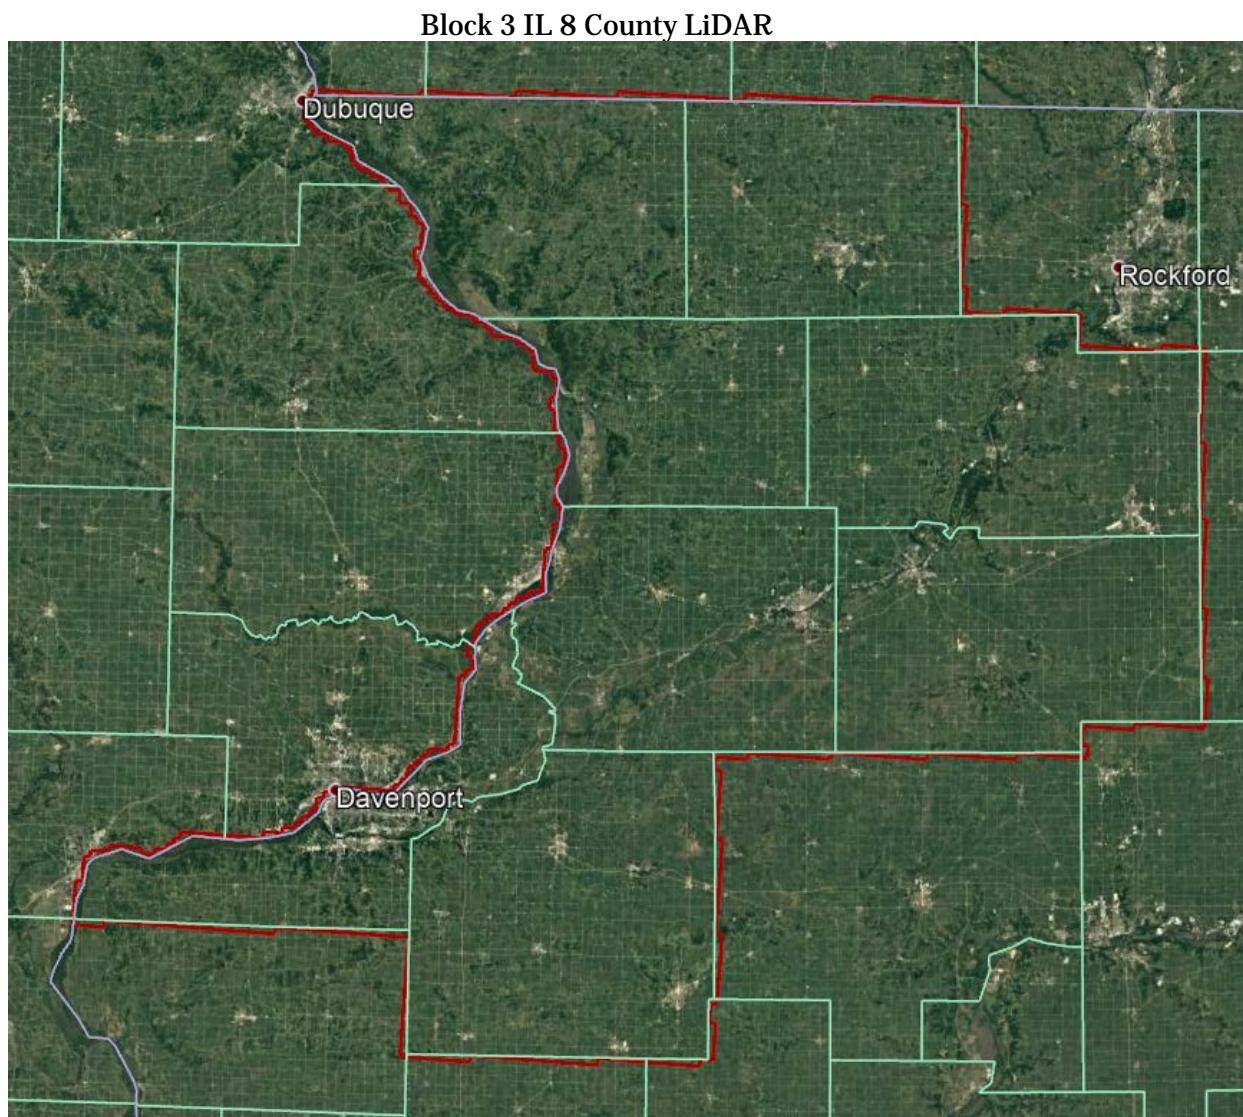

Project Extent (Included in breakline GDB)

**Swaths Extents (File GDB)**

Tile Index (included in breakline GDB)

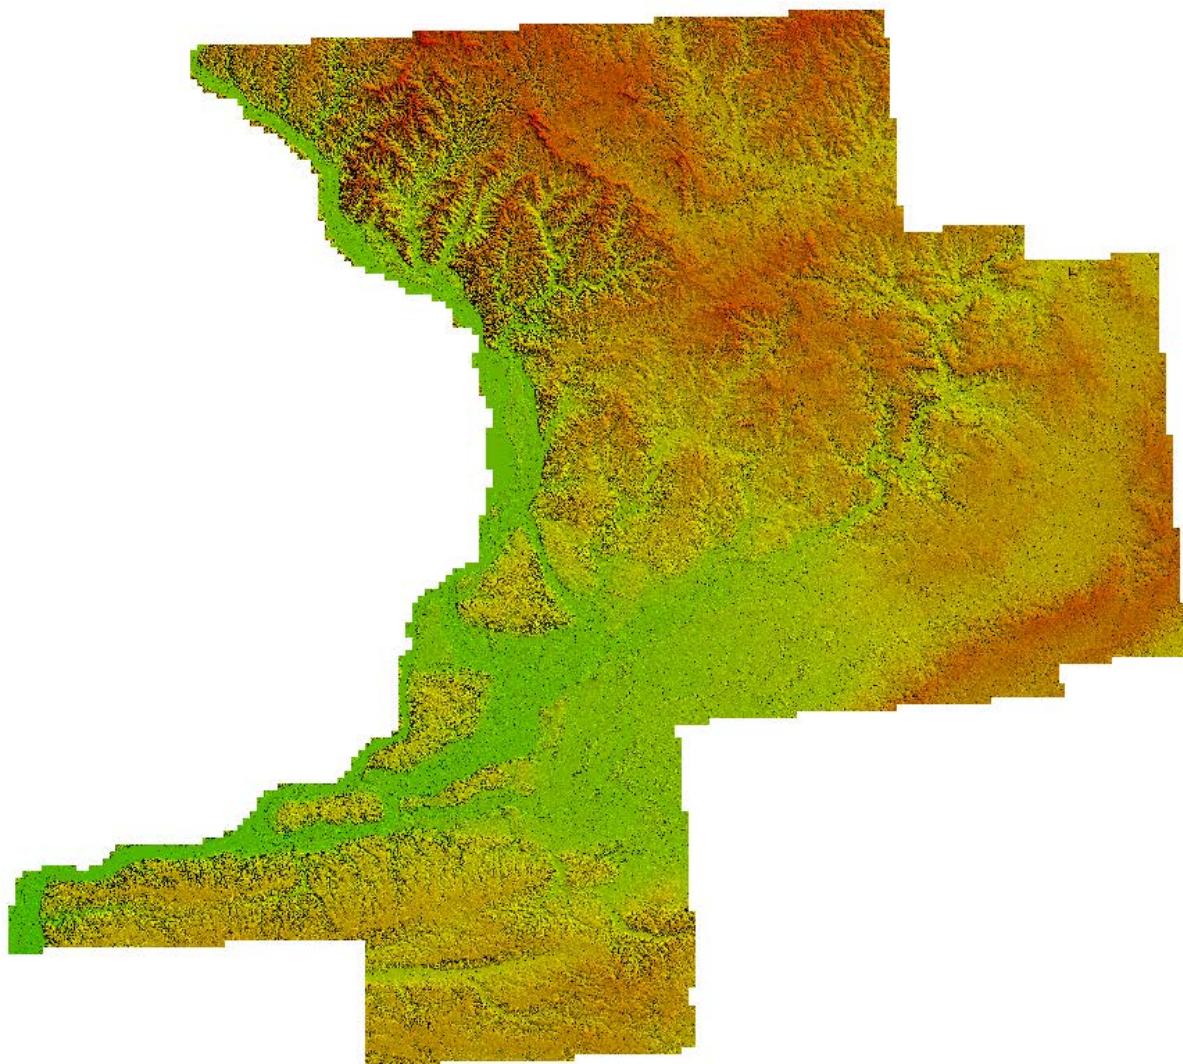

**PROJECT TILING FOOTPRINT**

14,482 tiles, 14,482 LAS files, 14,482 DEM tiles, and 14,481 Intensity Image tiles were delivered for the project. Each tile's extent is 1000 meter by 1000 meter. (See Appendix A for a complete listing of delivered tiles.)

## Lidar Acquisition Details Aerial Services Inc.

Aerial Services, Inc. served as prime contractor for the Block 3 IL 8 County project and preformed the LiDAR Acquisition and Calibration for Jo Daviess, Stephenson, Carroll, Ogle, Whiteside, Lee, and the northern 1/5 of Rock Island County.

Aerial Services, Inc. planned 142 passes for the project area as well as 11 additional cross flightlines for the purposes of quality control in our own processing which are not included in delivery. The flight plan included multiple flight directions to maximize county coverage while remaining short enough to avoid significant IMU drifting. In order to reduce any margin for error in the flight plan, Aerial Services, Inc. followed FEMA's Appendix A "guidelines" for flight planning and, at a minimum, includes the following criteria:

- A digital flight line layout using TrackAir Snapplan flight design software for direct integration into the aircraft flight navigation system.
- Planned flight lines; flight line numbers; and coverage area.
- Lidar coverage extended by a predetermined margin beyond all project borders to ensure necessary over-edge coverage appropriate for specific task order deliverables.
- Local restrictions related to air space and any controlled areas have been investigated so that required permissions can be obtained in a timely manner with respect to schedule. Additionally, Aerial Services, Inc. will file our flight plans as required by local Air Traffic Control (ATC) prior to each mission.

Aerial Services, Inc. monitored weather and atmospheric conditions and conducted lidar missions only when no conditions exist below the sensor that will affect the collection of data. These conditions include leaf-off for hardwoods, no snow, rain, fog, smoke, mist and low clouds. Lidar systems are active sensors, not requiring light, thus missions may be conducted during night hours when weather restrictions do not prevent collection. Aerial Services, Inc. accesses reliable weather sites and indicators (webcams) to establish the highest probability for successful collection in order to position our sensor to maximize successful data acquisition.

Within 72-hours prior to the planned day(s) of acquisition, Aerial Services, Inc. closely monitored the weather, checking all sources for forecasts at least twice daily. As soon as weather conditions were conducive to acquisition, our aircraft mobilized to the project site to begin data collection. Once on site, the acquisition team took responsibility for weather analysis.

Aerial Services, Inc. lidar sensors are calibrated at designated sites located in Waverly and Hudson, IA and they are periodically checked and adjusted to minimize corrections at project sites.

## LIDAR SYSTEM PARAMETERS

Aerial Services, Inc. operated a Cessna 210 (N5531A), Cessna 206 (N78AS), and Piper Navajo (N144AS) equipped with a Leica ALS70 LiDAR or a Riegl LMSQ-1560 system during the collection of this task order.

Item	Parameter	Parameter
System	Riegl LMS-Q1560	Leica ALS70
Maximum Number of Returns per Pulse	6	4
Nominal Pulse Spacing (single swath), (m)	0.5	0.5
Nominal Pulse Density (single swath) (ppsm), (m)	4	4
Altitude (AGL meters)	1500	1300
Approx. Flight Speed (knots)	130	125
Total Sensor Scan Angle (degree)	60	50
Scan Frequency (hz)	89	47
Scanner Pulse Rate (kHz)	400	393.6
Did the Sensor Operate with Multiple Pulses in The Air? (yes/no)	Yes	Yes
Nominal Swath Width on the Ground (m)	1725	1212
Swath Overlap (%)	30	30
Computed Down Track spacing (m) per beam	0.7	0.84
Computed Cross Track Spacing (m) per beam	0.72	1.37

Table 2: Aerial Services, Inc. Lidar System Parameters

## ACQUISITION STATUS REPORT AND FLIGHTLINES

Upon notification to proceed, the flight crew loaded the flight plans and validated the flight parameters. The Acquisition Manager contacted air traffic control and coordinated flight pattern requirements. Lidar acquisition began immediately upon notification that control base stations were in place. During flight operations, the flight crew monitored weather and atmospheric conditions. Lidar missions were flown only when no condition existed below the sensor that would affect the collection of data. The pilot constantly monitored the aircraft course, position, pitch, roll, and yaw of the aircraft. The sensor operator monitored the sensor, the status of PDOPs, and performed the first Q/C review during acquisition. The flight crew constantly reviewed weather and cloud locations. Any flight lines impacted by unfavorable conditions were marked as invalid and re-flown immediately or at an optimal time.

Figure 3 shows the combined trajectory of the flightlines by mission.

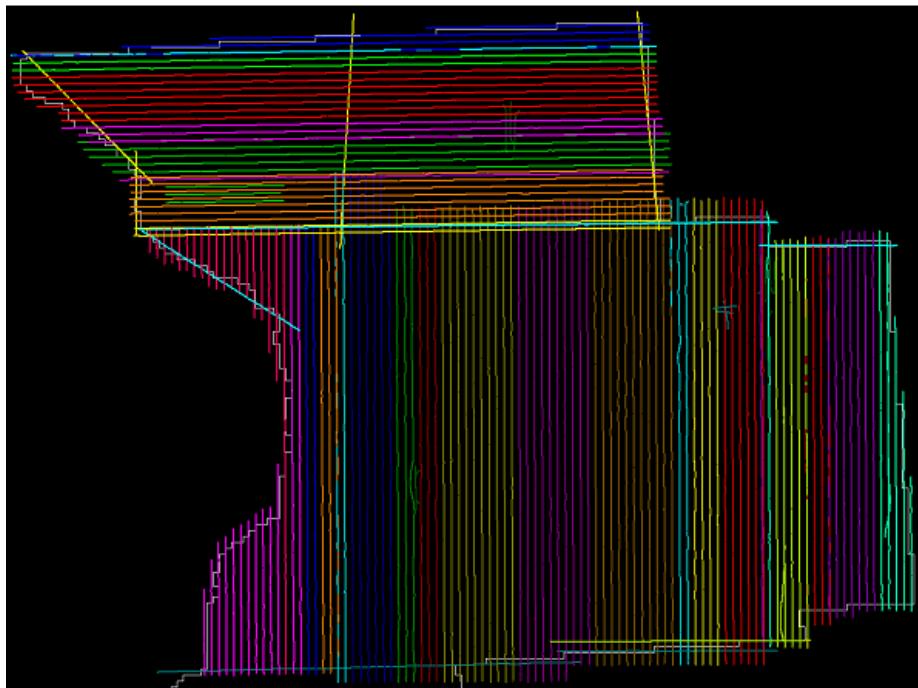

Figure 3: G17PC00007\_Block 3 IL 8 County\_2019\_B19 trajectories by mission as flown by Aerial Services, Inc.

## CALIBRATION REPORT

After processing the GNSS/GPS and IMU data in PosPac, LAS 1.4 point cloud data is then generated through Riegl software. RiProcess coordinates the activities of the following programs: RiAnalyze generates point records with timestamps, POF Import converts SBET trajectory information in to usable coordinates, and RiWorld combines the trajectory, calibration data, and point records into a 3-dimensional point cloud in the specified coordinate reference system and file format.

Relative accuracy and internal quality are checked using Terramatch, in which points from all lines are observed and compared. Vertical differences between ground surfaces of each line are displayed. Rasters are generated on filtered tiles to model Dz between adjacent lines. Inter-swath accuracy is tested to the <.08m standard specified in the base spec. Data are visually inspected across each block to validate point to point, flight line to flight line and mission to mission agreement.

A listing of Flightlines and corresponding, Lift\_ID, Date, Point Source ID, Scanner, and adjusted GPS times are available in table 3.

## ACQUISITION CONTROL

Aerial Services, Inc. conducted the survey which provided the established base stations used to control the lidar acquisition for the Block 3 IL 8 County project area. The coordinates of the base stations are provided in the table 4 below.

Table 4: Base station used to control lidar acquisition for the Project.

## AIRBORNE GPS KINEMATIC

Airborne GPS data was processed using Applanix PosPac 8.2 software. All flights were flown with PDOP less than or equal to 3.0 and with at least 6 satellites in common view of both a stationary reference receiver and the airborne GPS. Distances from base station to aircraft were kept to a maximum of 50 km.

For all flights, the GPS data can be classified as excellent, with GPS residuals no larger than 10 cm being recorded.

GPS processing reports for each mission are included in Appendix B.

## GENERATION AND CALIBRATION OF LASER POINTS (RAW DATA)

The initial step of calibration is to verify availability and status of all needed GPS and Laser data against field notes and compile any data if not complete.

The initial points for each mission are inspected for flight line errors, flight line overlap, slivers or data holidays, point data minimums or issues with the LiDAR unit or GPS. Data collected by the LiDAR unit is reviewed for completeness, acceptable density and errors or corrupted values. Intra-swath repeatability is tested to meet the <.06m standard specified in the base spec. In addition, all GPS data, aircraft trajectories, mission information and ground control files are reviewed. On a project level, a supplementary coverage check is carried out to ensure data voids unreported by Field Operations are not present.

Data collected by the lidar unit is reviewed for completeness, acceptable point density and to make sure all data is captured without errors or corrupted values. In addition, all GPS, aircraft trajectory, mission information, and ground control files are reviewed and logged

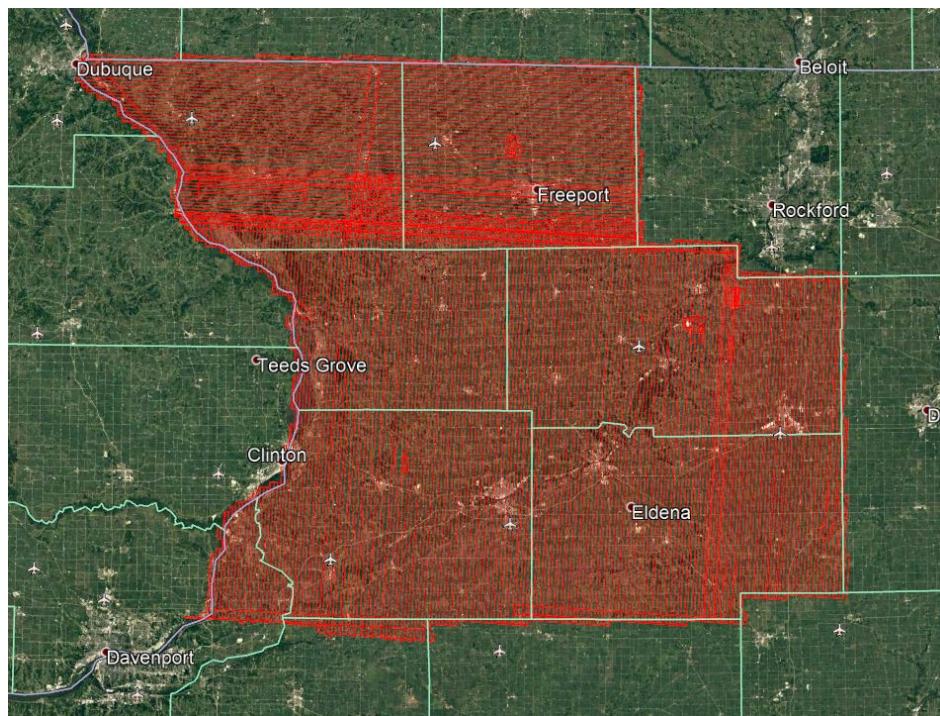

Figure 4: G17PC00007\_Block 3 IL 8 County\_2019\_B19 Lidar swath coverage over AOI.

## Boresight and Relative Accuracy

Subsequently, the project's data is then loaded into Microstation/TerraScan for viewing and post-processing of calibration errors. Small roll, pitch, heading, and elevation corrections are calculated using TerraMatch tie line methodology to produce the best relative accuracy that can be achieved to meet 8 cm RMSDz specification.

The relative accuracy of every swath is checked and QC'd at 3 different points along its length. Cross sections are visually inspected across each block to validate point to point, flight line to flight line and mission to mission agreement to verify that the project meet the specifications.

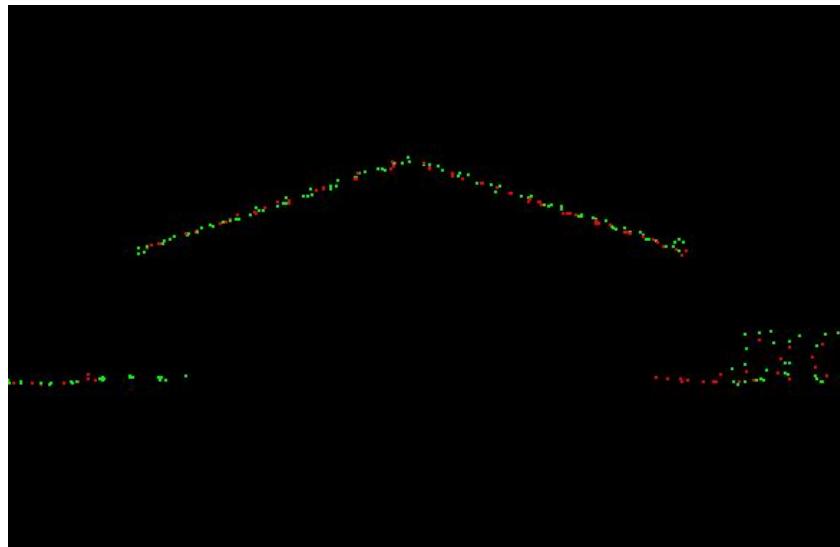

Figure 5: Profile view showing proper interswath calibration.

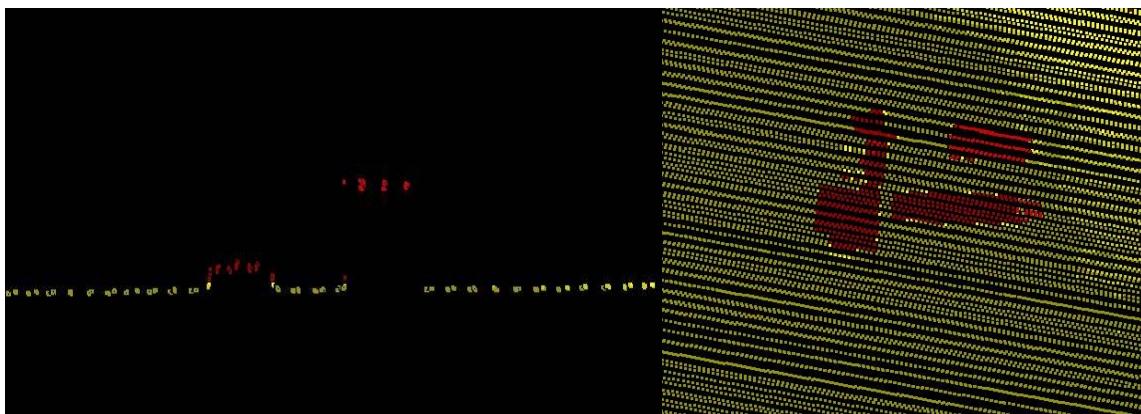

Figure 6: Top view showing a parking lot with a car and raised feature on a single swath demonstrating intraswath accuracy. Yellow color is scaled to a range of 6 cm in elevation. Points are within 6 cm of variation until the raised curb and car. Also shown is a profile view showing low variability of ranges within the swath.

## DELTA-Z ACCURACY ASSESSMENT

Swath-to-swath relative accuracy is assessed by comparing the elevations of overlapping swaths. Delta-z is a raster file representing the differences in elevation of overlapping swaths and is generated from the subtraction of the two raster files created from each swath over the entire area of interest. It is then used to calculate the RMSDz, which in turn is displayed as a visual representation of error distribution.

The image below is a LiDAR “ortho” image created from the laser return intensity, Z (elevation) and swath number. The image is rendered as grayscale where there is no overlap between data from different flight lines (swath). Where two (or more) flight lines overlap, a color rendering is constructed base on the average maximum elevation difference between points in the overlapping swath. The distance (dZ) is indexed into a user-defined color. In the image below, four-color bands were separated into 8 cm increments. Thus green represents dZs from 0 to 8 cm, yellow from 8 cm to 16 cm, orange from 16 cm to 24 cm and red for dZ greater than 24 cm. The dZ image provides a quick method of quickly assessing the relative vertical accuracy of a LiDAR project.

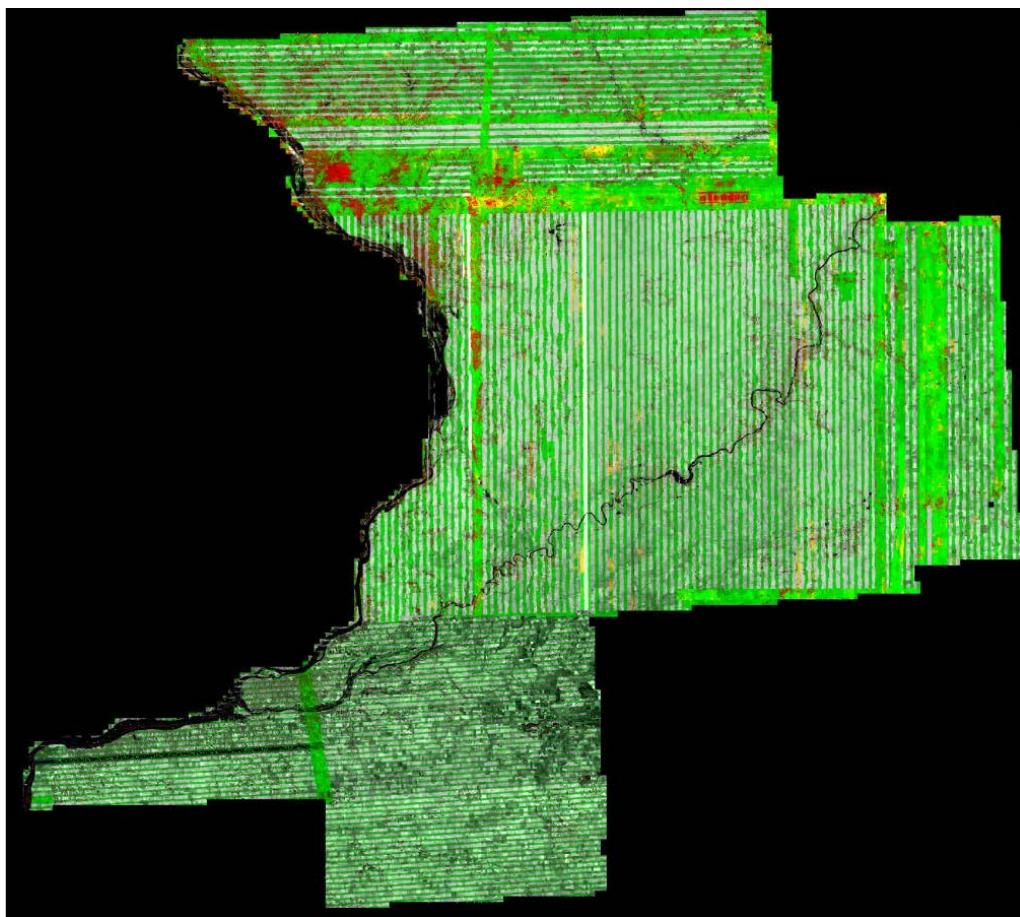

Figure 7: Block 3 IL 8 County Project Delta-z raster image.

## Final Calibration Verification

Surveying and Mapping, LLC (SAM) conducted the survey for 76 ground control points (GCPs) which were used to test the accuracy of the calibrated swath data. These 76 GCPs were available to use as control in case the swath data exhibited any biases which would need to be adjusted or removed. The coordinates of all GCPs are provided in table 5 below. Accuracy results from testing the calibrated swath data against the GCPs is provided in table 6. The accuracy of the raw point cloud against GCP is 0.05 meters (5.0 cm) with a 95% confidence value of 0.098 meters (9.8 cm)

## SurvTech Solutions LiDAR Acquisition Details and System Parameters for USGS IL-8cty

SurvTech Solutions planned 82 passes for the project area as well as a series of cross flightlines for quality control. In order to reduce any margin for error in the flight plan, SurvTech Solutions followed FEMA's Appendix A guidelines for flight planning and, at a minimum, includes the following criteria:

- A digital flight line layout using Optech's AMM Software flight design software for direct integration into the aircraft flight navigation system.
- Planned flight lines; flight line numbers; and coverage area.
- Lidar coverage extended beyond all project borders to ensure necessary over-edge coverage appropriate for specific task order deliverables. A buffered AOI was provided by ASI.
- All airspace was coordinated and any controlled or restricted areas were pre coordinated and approval granted from the airspace owner.

SurvTech Solutions operated a Cessna 401 (Registration N41GD ) equipped with a Teledyne Optech Galaxy Prime Lidar system during the collection of this task order. Data was acquired between April 26, 2020 and April 30, 2020.

Item	Parameter
System	Optech Galaxy Prime
Maximum Number of Returns per Pulse	8
Nominal Pulse Spacing (single swath), (m)	0.45
Nominal Pulse Density (single swath) (ppsm), (m)	5.84
Aggregate NPS (m) (if ANPS was designed to be met through single coverage, ANPS and NPS will be equal)	0.45
Aggregate NPD (m) (if ANPD was designed to be met through single coverage, ANPD and NPD will be equal)	4
Altitude (AGL meters)	1829
Approx. Flight Speed (knots)	150
Total Sensor Scan Angle (degree)	40
Scan Frequency (hz)	85
Scanner Pulse Rate (kHz)	400
Did the Sensor Operate with Multiple Pulses in The Air? (yes/no)	Yes
Nominal Swath Width on the Ground (m)	1331
Swath Overlap (%)	30
Computed Down Track spacing (m) per beam	0.46
Computed Cross Track Spacing (m) per beam	0.45

Table 7 - SURVTECH SOLUTIONS LiDAR system parameters

## CALIBRATION REPORT

Point clouds are output using Optech's LMS. The initial point generation for each mission calibration is verified within LMS for calibration errors. If significant calibration errors are observed within the mission; the internal sensor misalignments are calculated. The data is then regenerated with the new solution and is validated internally once again to ensure quality.

Relative accuracy and internal quality are checked using Terramatch, as well as, BayesMap-StripAlign, in which points from all lines are observed and compared. Vertical differences between ground surfaces of each line are displayed. Rasters are generated on filtered tiles to model Dz between adjacent lines. Inter-swath accuracy is tested to the <.08m standard specified in the base spec. Data are visually inspected across each block to validate point to point, flight line to flight line and mission to mission agreement.

A listing of Flightlines and corresponding, Lift\_ID, Date, Point Source ID, Scanner, and adjusted GPS times are available in table 8.

Name	Lift_ID	Date	PT Source ID	Scanner	Start Time	End Time

## ACQUISITION CONTROL

SurvTech Solutions conducted the survey which provided the established base stations used to control the lidar acquisition for USGS IL-8cty project area. The coordinates of the base stations are provided in the table below.

Name	NAD83(2011) Decimal Degrees		Ellipsoid Ht (WGS84, m)
	Easting X	Northing Y	
IADA	-90.630429	41.610050	201.6822

Table 9: Base station used to control lidar acquisition for the Project.

## AIRBORNE GPS KINEMATIC

Airborne GPS data was processed using PosPac MMS 8.0. Flights were flown with a minimum of 8 satellites in view ( $10^{\circ}$  above the horizon) and with a PDOP of better than 4. Distances from base station to aircraft were kept to a maximum of 80km.

For all flights the GPS data can be classified as good with GPS residuals of 3cm average or better but no larger than 10cm being recorded. GPS processing reports for each mission are included in Appendix C.

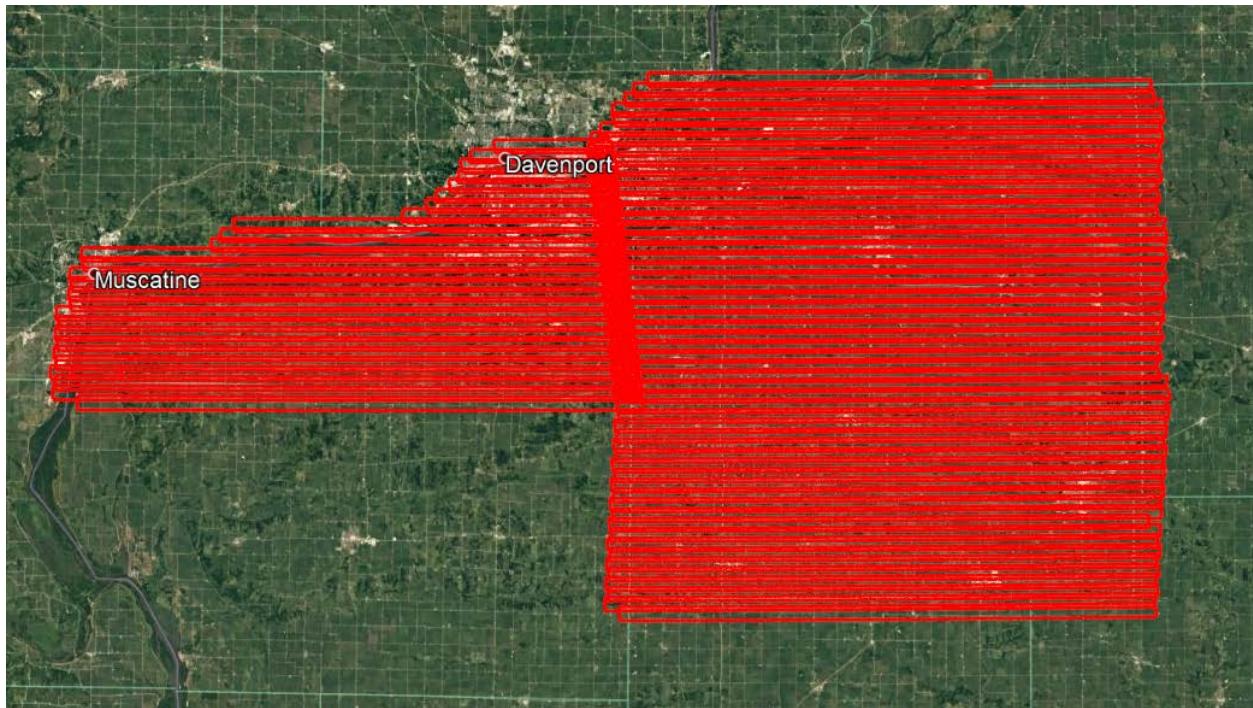

## GENERATION AND CALIBRATION OF LASER POINTS (RAW DATA)

The initial step of calibration is to verify availability and status of all needed GPS and Laser data against field notes and compile any data if not complete.

The initial points for each mission are inspected for flight line errors, flight line overlap, slivers or data holidays, point data minimums or issues with the LiDAR unit or GPS. Data collected by the LiDAR unit is reviewed for completeness, acceptable density and errors or corrupted values. Intra-swath repeatability is tested to meet the  $<.06m$  standard specified in the base spec. In addition, all GPS data, aircraft trajectories, mission information and ground control files are reviewed. On a project level, a supplementary coverage check is carried out to ensure data voids unreported by Field Operations are not present.

Data collected by the lidar unit is reviewed for completeness, acceptable point density and to make sure all data is captured without errors or corrupted values. In addition, all GPS, aircraft trajectory, mission information, and ground control files are reviewed and logged into a database.

On a project level, a supplementary coverage check is carried out to ensure no data voids unreported by Field Operations are present.

**Figure 8: LiDAR swath output showing complete coverage**

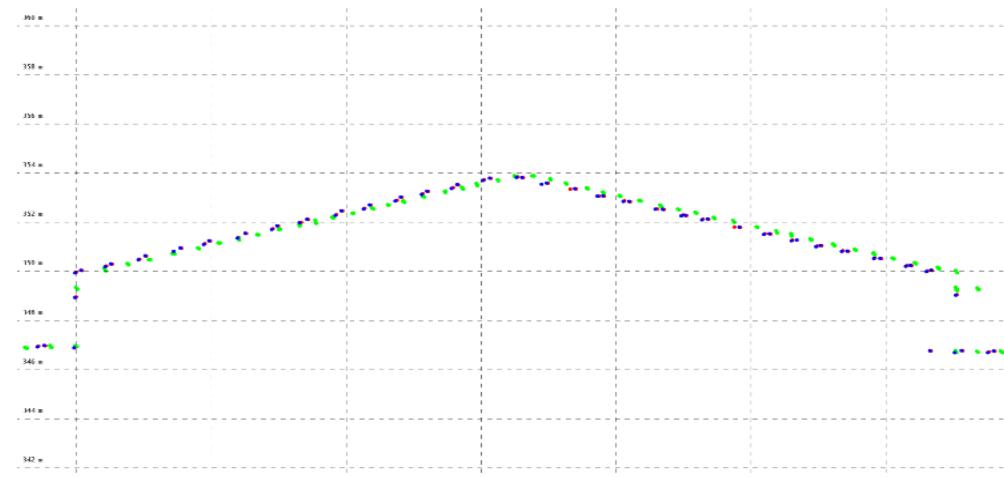

## Boresight and Relative Accuracy

The initial points for each mission calibration are inspected for flight line errors, flight line overlap, slivers, or gaps in the data, point data minimums, or issues with the lidar unit or GPS. Roll, pitch, and scanner scale are optimized during the calibration process until the relative accuracy is met.

Relative accuracy and internal quality are checked using at least 3 regularly spaced QC blocks in which points from all lines are loaded and inspected. Vertical differences between ground surfaces of each line are displayed. Color scale is adjusted so that errors greater than the specifications are flagged. Cross sections are visually inspected across each block to validate point to point, flight line to flight line and mission to mission agreement.

For this project, the specifications used are as follows (derived from LiDAR base specification 2.1, QL2):

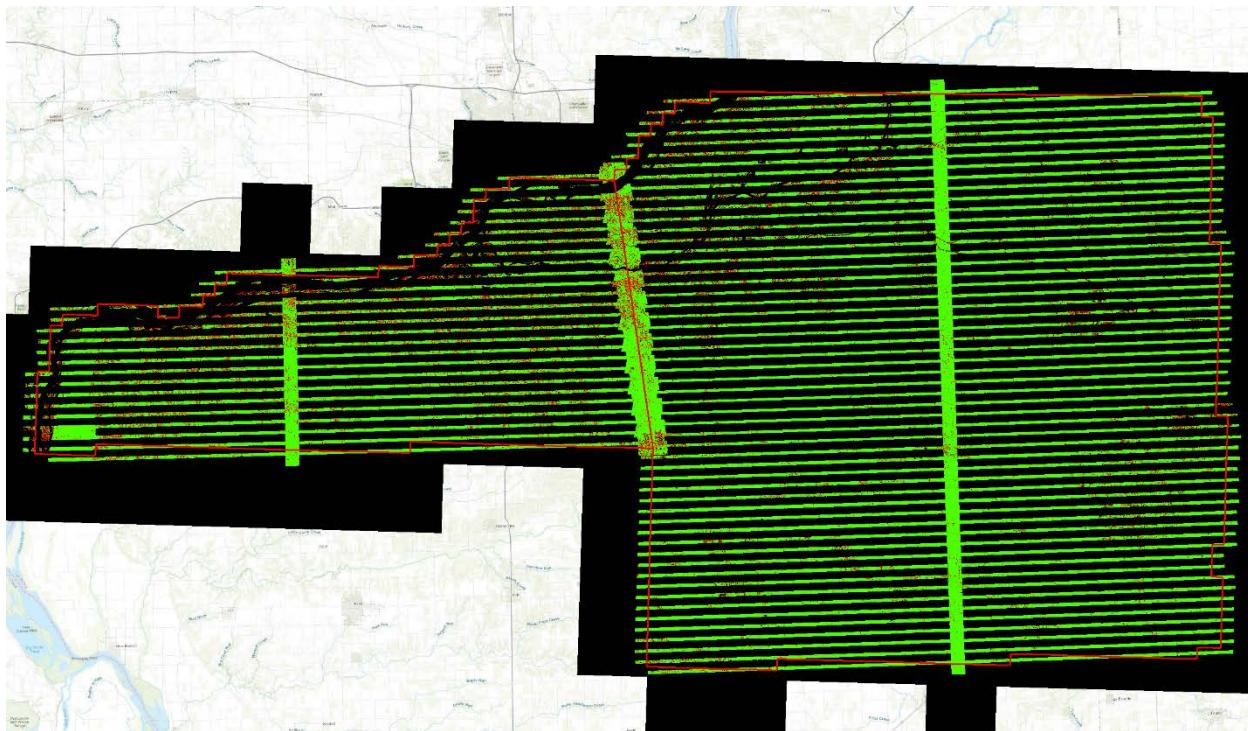

Relative accuracy (smooth surface repeatability)  $\leq 6$  cm maximum differences within individual swaths and  $\leq 8$  cm RMSDz between adjacent and overlapping swaths.

showing correct roll and pitch adjustments

Figure 2- Profile views

## Final Calibration Verification

Surveying & Mapping, LLC (SAM) conducted the survey throughout the area of interest. 25 ground control points (GCPs) were used to test the accuracy of the calibrated swath data. These 25 GCPs were available to use as control in case the swath data exhibited any biases which would need to be adjusted or removed. The coordinates of all GCPs are provided in Figure 3- Surveyed ground control points (GCPs) and the accuracy results from testing the calibrated swath data against the GCPs is provided in the following Tables. Ground control points (GCPs) vertical accuracy results (vegetated and non-vegetated); no further adjustments to the swath data were required based on the accuracy results of the GCPs.

## LiDAR Quality Control Reporting

### OVERVIEW

SurvTech Solutions conducted the evaluation of calibrated data for USGS IL-8cty to ensure that the swath lidar has been calibrated and produced to meet the required specifications in the Scope of Work (SOW). This review includes verifying the calibration and final formatting of the swath data. Between swath relative accuracy, horizontal alignment, and LAS statistics were reviewed. Results of this review are provided below.

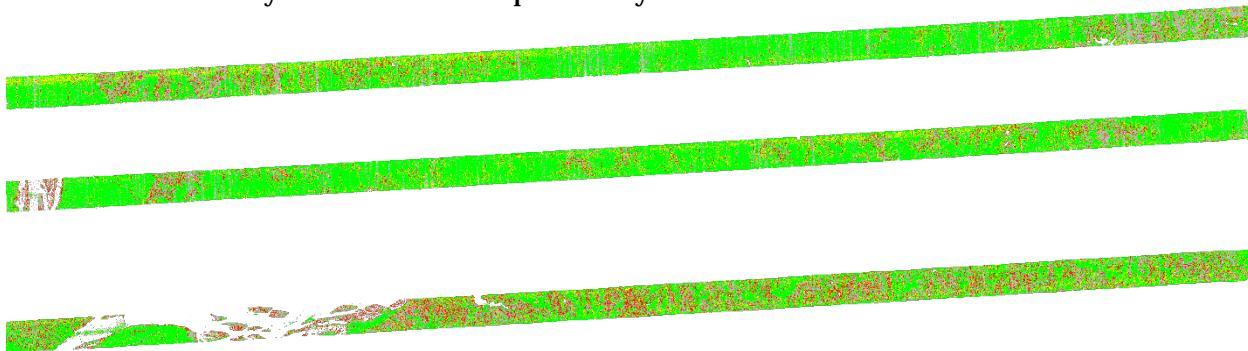

### BETWEEN SWATH RELATIVE ACCURACY (DZ ORTHOS):

Inter-swath relative accuracy passes specification. All pixels colored green are areas where overlapping flight lines are within 8 cm of each other. Areas colored red are where differences greater than 8 cm exist (this is expected in vegetated and sloped areas).

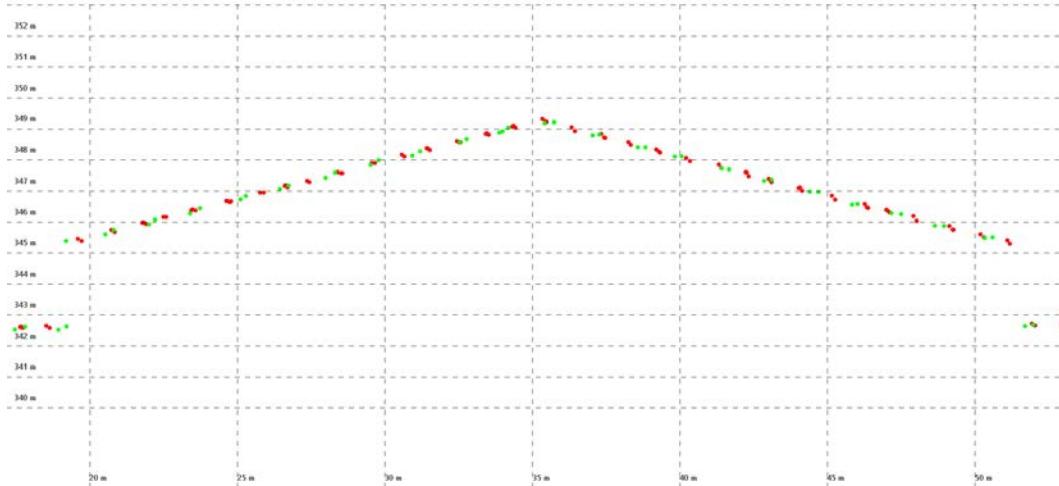

### WITHIN SWATH RELATIVE ACCURACY (INTRASWATH):

Intra-swath relative accuracy was reviewed and passes specification. All flight lines were reviewed to confirm intra-swath within 8 cm (green) of each other on flat plainer surfaces. Areas colored red are where differences greater than 8 cm exist. Red areas are expected in vegetated and sloped areas as this is an assessment only of hard surface repeatability.

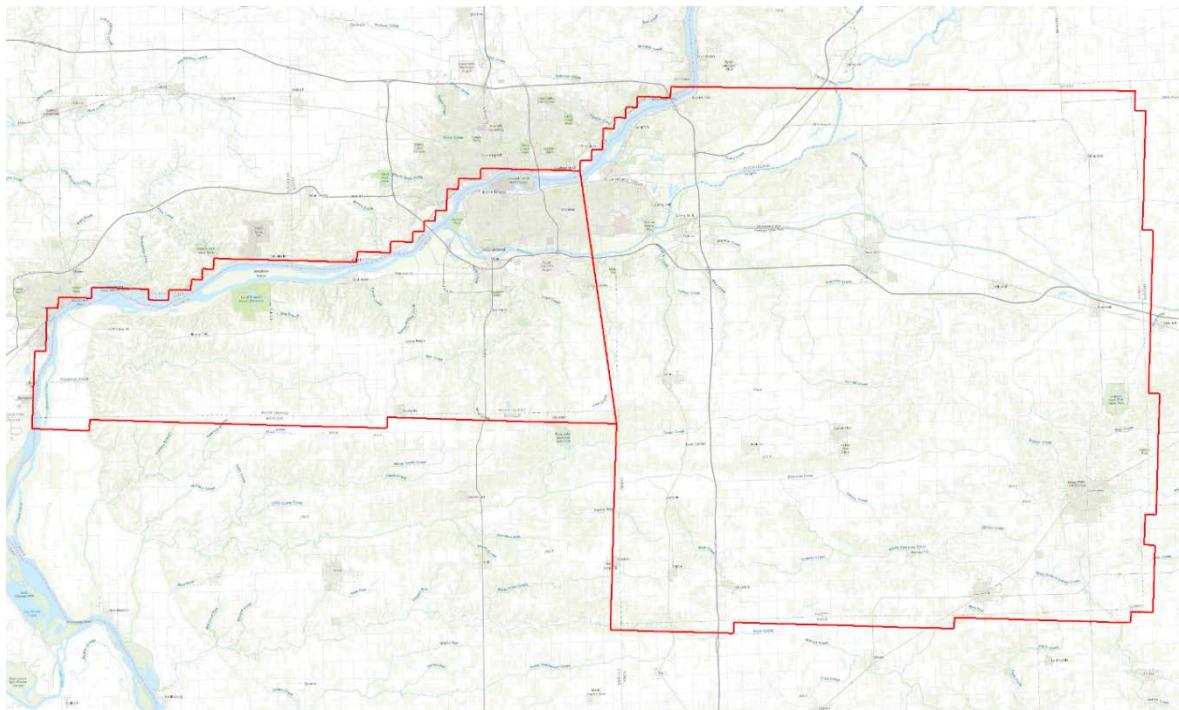

**HORIZONTAL ALIGNMENT/CALIBRATION CHECK (ROOFTOPS/PLANAR SURFACE PROFILES):**

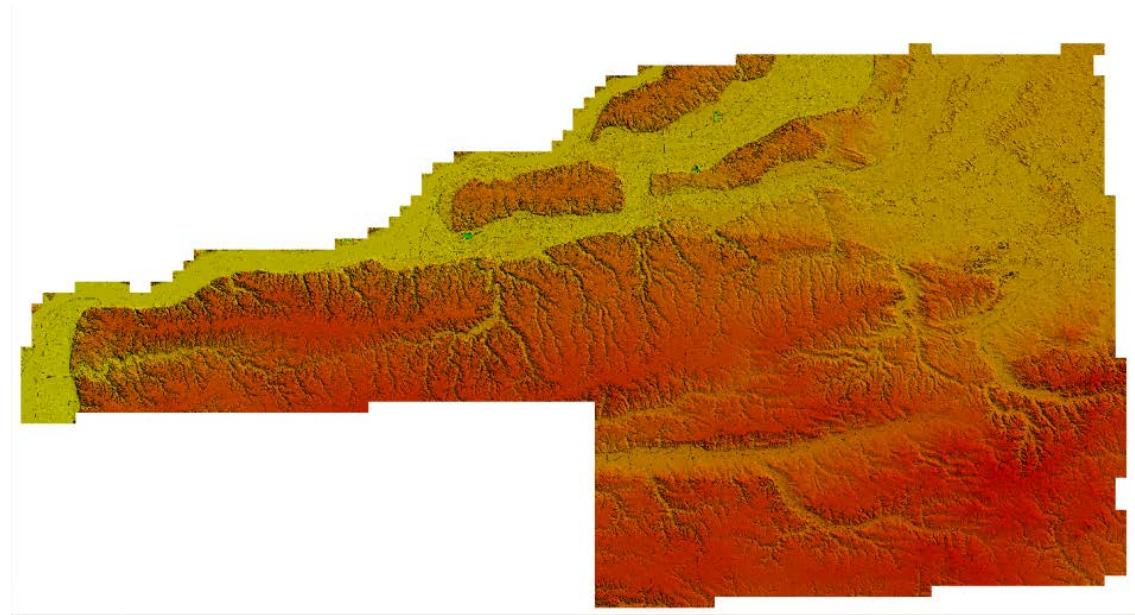

The profiles show lidar points colored by flight line. The overlapping flight lines match and there is no horizontal (or vertical) offset between the flight lines.

## DATA CLASSIFICATION AND EDITING

Once the calibration, absolute swath vertical accuracy, and relative accuracy of the data were confirmed, ASI utilized TerraScan software for data processing. The acquired 3D laser point clouds, in LAS binary format, were imported into the project and tiled according to the project tile grid. Once tiled, the laser points were classified using a proprietary routine in TerraScan. This routine classifies any obvious low outliers in the dataset to class 7 and high outliers in the dataset to class 18. After points that could negatively affect the ground are removed from class 1, the ground layer is extracted from this remaining point cloud. The ground extraction process encompassed in this routine takes place by building an iterative surface model. This surface model is generated using three main parameters: building size, iteration angle and iteration distance. The initial model is based on low points being selected by a "roaming window" with the assumption that these are the ground points. The size of this roaming window is determined by the building size parameter. The low points are triangulated and the remaining points are evaluated and subsequently added to the model if they meet the iteration angle and distance constraints. This process is repeated until no additional points are added within iterations. A second critical parameter is the maximum terrain angle constraint, which determines the maximum terrain angle allowed within the classification model.

Once the ground surface had been deduced through the filtering process a vegetation class was then extracted by distance from ground from the remaining class 1. Vegetation points were filtered by distance into Low Vegetation is 0.5-5 feet, Medium Vegetation is 5-20 feet, High Vegetation is >20 feet from the ground. Classes 3, 4, and 5 define low, medium, and high vegetation points respectively and were classified using an automated method. These vegetation classes represent all non-noise points that fall into the distances above the ground surface, and will likely include buildings, utility poles, powerlines, and other infrastructure.

In TerraScan surface models for each tile was created to examine the ground classification. ASI analysts visually reviewed the ground surface model for artifacts left in the ground classification. These artifacts consist of vegetation, buildings, and bridges that were still present in the ground after initial processing. ASI analysts employ 3D visualization techniques to view the point cloud at multiple angles and in profile to ensure that errant points are removed from the ground classification. Bridge decks are manually classified to class 17. After the ground classification had been completed, the dataset was processed through a water classification routine that utilized breaklines compiled by the Prime and Subcontractor to automatically classify hydro features. The water classification routine selects ground points within the breakline polygons and automatically classifies them as class 9, water. During this water classification routine, ground points that are within 2x NPS or less of the hydrographic features are moved to class 20 ignored ground, due to breakline proximity. Overage points are then identified in TerraScan and used to set the overlap bit for those points. The withheld points identified during the classification routine are used to set the withheld bit. The LiDAR tiles were classified to the following classification schema:

- o Class 1 – Default, Processed, but unclassified
- o Class 2 – Ground, Bare-earth
- o Class 3 – Low Vegetation is 0.5-5 feet
- o Class 4 – Medium Vegetation is 5-20 feet
- o Class 5 – High Vegetation is >20 feet

- o Class 7 – Low Noise (low and manually identified)
- o Class 9 – Water
- o Class 17 – Bridge Decks
- o Class 18 – High Noise (high, manually identified)
- o Class 20 – Ignored Ground (Breakline Proximity)

After manual classification, the LAS tiles were peer reviewed and then underwent a final QA/QC. After the final QA/QC and corrections, the LAS files were then converted from LAS v1.2 to LAS v1.4 using TerraScan software to flag the overlap bit and withheld bit. An LP360 64 bit was used to deduce the Well Known Text (WKT) and ASI proprietary software was used to format the LAS to the final LAS v1.4 Format 6 version. LAStools by rapidlasso GmbH, open source, lasInfo (open source LGPL) and ASI proprietary software was used to perform final analysis to checks on LAS header information, LAS point classes, and LAS timestamps.

This project consists of 119,347,163,080 lidar points the table below shows the total number of points for every class.

Project Count by Class		
Class 1	Processed, unclassified	21361829926
Class 2	Bare-earth ground	38718958422
Class 3	Low vegetation (0.5-5 ft)	1599404165
Class 4	Medium vegetation (5-20 ft)	3493724918
Class 5	High vegetation (>20 ft)	7596791141
Class 7	Low Noise	68532366
Class 9	Water	134226386
Class 17	Bridge Decks	5088690
Class 18	High Noise	217996338
Class 20	Ignored_Ground	4492192
Class Overlap 1	Overlap Processed, unclassified	15470110973
Class Overlap 2	Overlap Bare-earth ground	14730437957
Class Overlap 3	Overlap Low vegetation (0.5-5 ft)	978716001

Class Overlap 4	Overlap Medium vegetation (5-20 ft)	1706745310
Class Overlap 5	Overlap High vegetation (>20 ft)	3465034698
Class Overlap 7	Overlap Low Noise	3107641
Class Overlap 9	Overlap Water	8315335
Class Overlap 17	Overlap Bridge Decks	2736413
Class Overlap 18	Overlap High Noise	59918671
Class Overlap 20	Overlap Ignored_Ground	1503301
Class Withheld 1	Withheld Processed, unclassified	1736488666
Class Withheld 2	Withheld Bare-earth ground	860580366
Class Withheld 3	Withheld Low vegetation (0.5-5 ft)	89017532
Class Withheld 4	Withheld Medium vegetation (5-20 ft)	144776079
Class Withheld 5	Withheld High vegetation (>20 ft)	296589660
Class Withheld 7	Withheld Low Noise	1796187
Class Withheld 9	Withheld Water	621984
Class Withheld 17	Withheld Bridge Decks	50512
Class Withheld 18	Withheld High Noise	14079281
Class Withheld 20	Withheld Ignored_Ground	33752
Class Overlap Withheld 1	Overlap Withheld Processed, unclassified	3669582271
Class Overlap Withheld 2	Overlap Withheld Bare-earth ground	1752286049
Class Overlap Withheld 3	Overlap Withheld Low vegetation (0.5-5 ft)	240507852
Class Overlap Withheld 4	Overlap Withheld Medium vegetation (5-20 ft)	322287289

Class Overlap Withheld 5	Overlap Withheld High vegetation (>20 ft)	568935740
Class Overlap Withheld 7	Overlap Withheld Low Noise	1993044
Class Overlap Withheld 9	Overlap Withheld Water	185122
Class Overlap Withheld 17	Overlap Withheld Bridge Decks	91463
Class Overlap Withheld 18	Overlap Withheld High Noise	19536898
Class Overlap Withheld 20	Overlap Withheld Ignored_Ground	52489
Project Total Count		119347163080

## LiDAR QUALITATIVE ASSESSMENT

ASI's qualitative assessment utilizes a combination of statistical analysis and interpretative methodology or visualization to assess the quality of the data for a bare-earth digital terrain model (DTM). This includes creating pseudo image products such as LiDAR orthos produced from the intensity returns, Triangular Irregular Network (TIN)'s, Digital Elevation Models (DEM) and 3-dimensional models as well as reviewing the actual point cloud data. This process looks for anomalies in the data, areas where man-made structures or vegetation points may not have been classified properly to produce a bare-earth model, and other classification errors. This report will present representative examples where the LiDAR and post processing had issues as well as examples of where the LiDAR performed well.

## VISUAL REVIEW

The following sections describe common types of issues identified in LiDAR data and the results of the visual review for Block 3 IL 8 County project.

### Data Voids

Acceptable voids (areas with no LiDAR returns in the LAS files) that are present in the majority of LiDAR projects include voids caused by bodies of water. No unacceptable voids are present in the Block 3 IL 8 County project.

### Bridge Removal Artifacts

The DEM surface models are created from TINs or Terrains. TIN and Terrain models create continuous surfaces from the inputs. Because a continuous surface is being created, the TIN or Terrain will use interpolation to continue the surface beneath the bridge where no LiDAR data was acquired. Locations where bridges were removed will generally contain less detail in the bare-earth surface because these areas are interpolated. The DEM in the bottom view shows an area where a bridge has been removed from ground. The surface model must make a continuous model and in order to do so, points are connected through interpolation. This results in less detail where the surface must be interpolated. The profile in the top view shows the LiDAR points of this particular feature colored by class. All bridge points have been removed from ground (orange) and are bridge deck (blue).

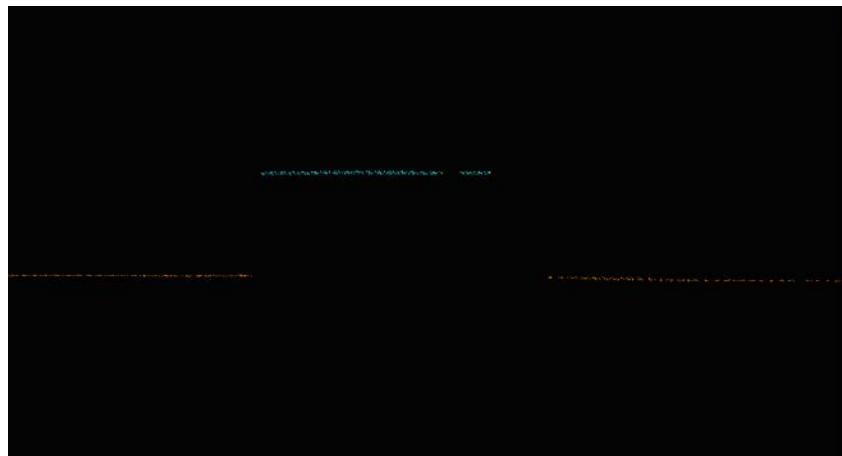

Figure 9: Profile view of a classified bridge deck (blue) and ground (orange).

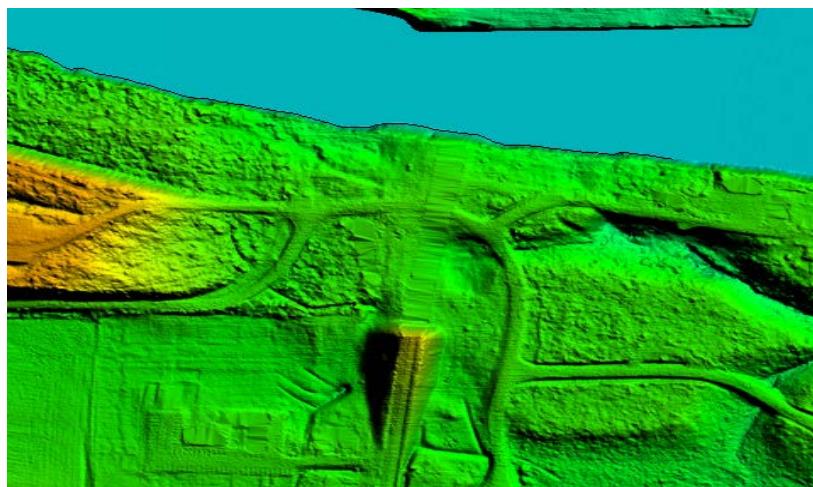

Figure 10: DEM with bridge removed from surface model.

## Culverts

Bridges have been removed from the bare earth surface while culverts remain in the bare earth surface. In instances where it is difficult to determine if the feature is a culvert or bridge, such as with some small bridges, ASI erred on assuming they would be culverts especially if they are on secondary or tertiary roads. Below is an example of a culvert that has been left in the ground surface.

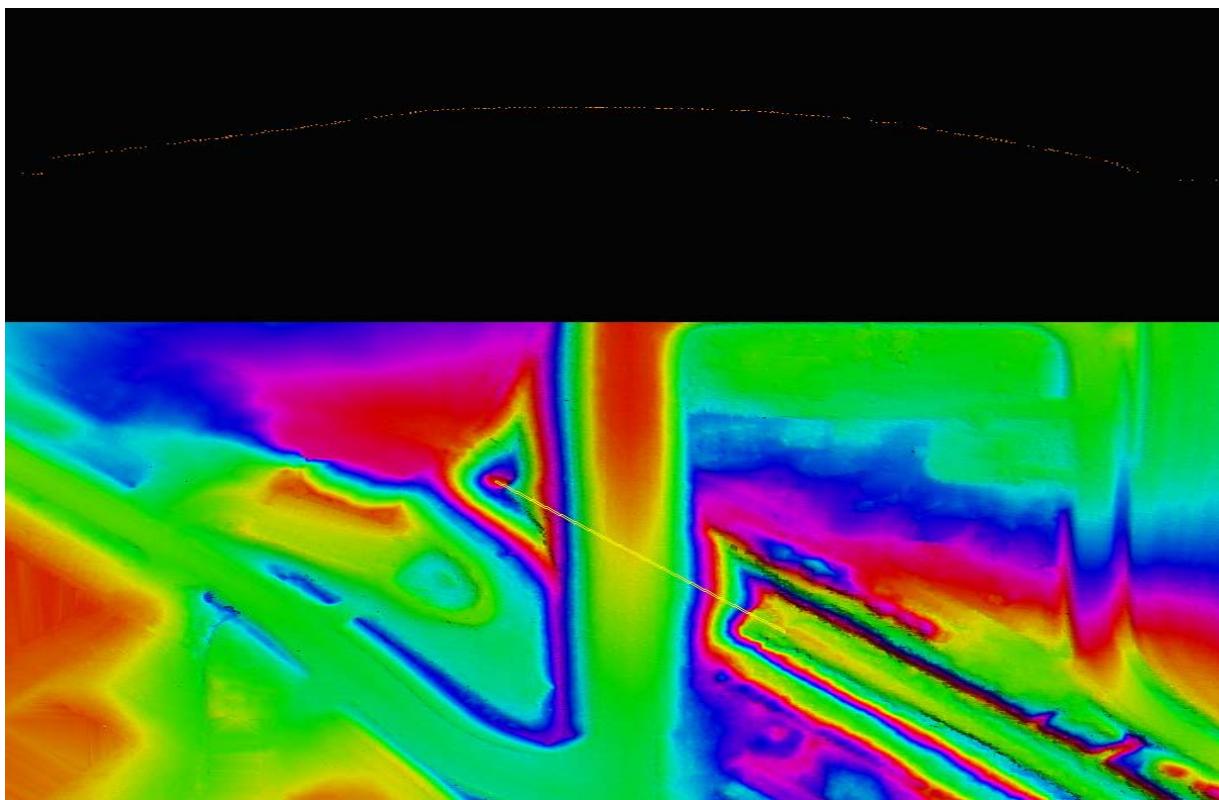

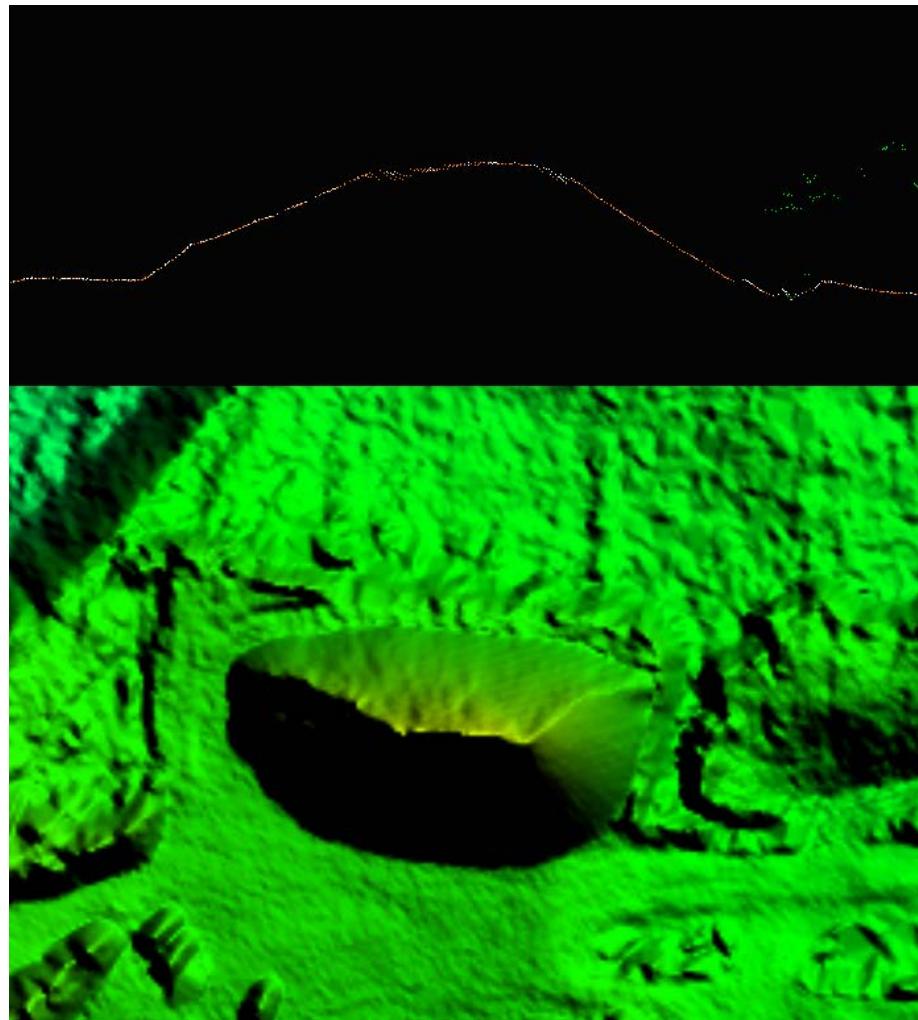

Figure 11: Profile with points colored by class (class 1=white, class 2=orange) is shown in the top view and the DEM is shown in the bottom view. This culvert remains in the bare earth surface. Bridges have been removed from the bare earth surface and classified to class 17.

### Dirt Mounds

Irregularities in the natural ground exist and may be misinterpreted as artifacts that should be removed. Hills and dirt mounds are present throughout the project area. These features are correctly included in the ground.

**Figure 12:** Profile with the points colored by class (unclassified points are white, ground points are orange) is shown on the right and a DEM of the surface is shown to the left. These features are correctly included in the ground classification.

## Flightline Ridges

Ridges occur when there is a difference between the elevations of adjoining flight lines or swaths. Some flightline ridges are visible in the final DEMs but they do not exceed the project specifications and the overall relative accuracy requirements for the project area have been met. An example of a visible flightline ridge that is within tolerance is shown below.

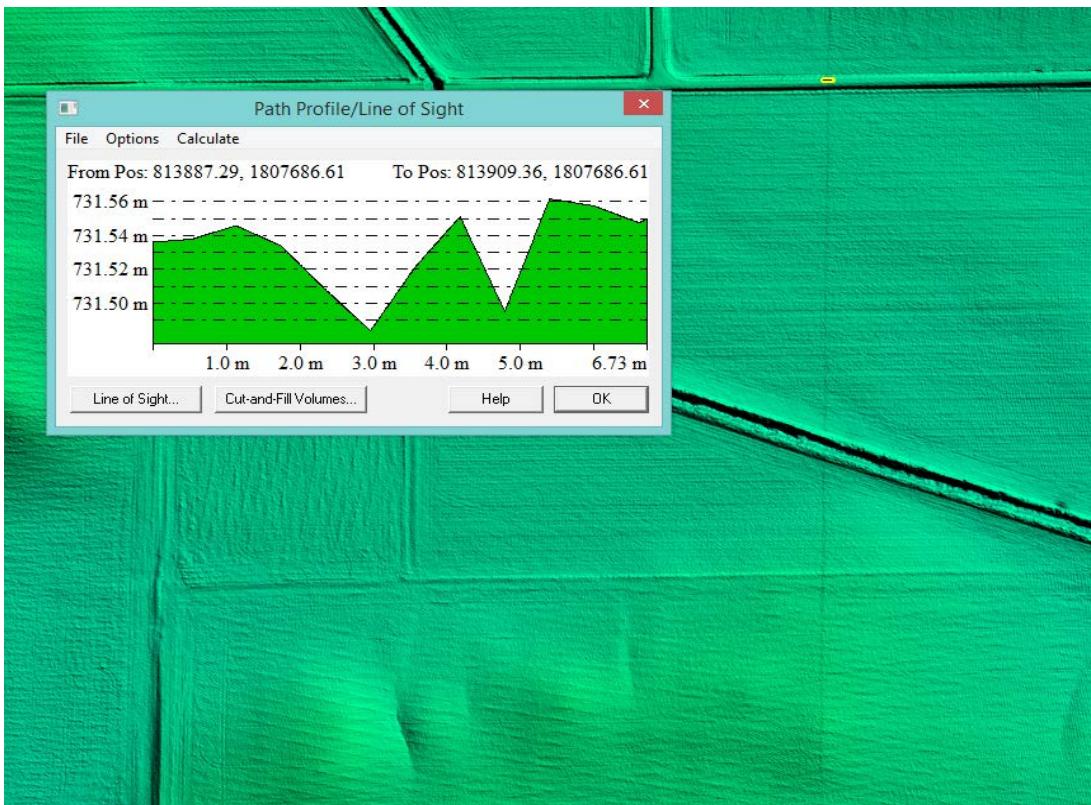

Figure 13: The flight line ridge is less than 8 cm. Overall, the Block 3 IL 8 County project data meets the project specifications for 8 cm RMSDz relative accuracy requirement.

### Dam and Lock system

Irregularities in the natural water flow exist in sections of river affected by Lock and Dam systems. Series of locks enable vessels to "step" up or down a river or canal from one water level to another. There are Lock systems in the Block 3 IL 8 County Lidar project area.

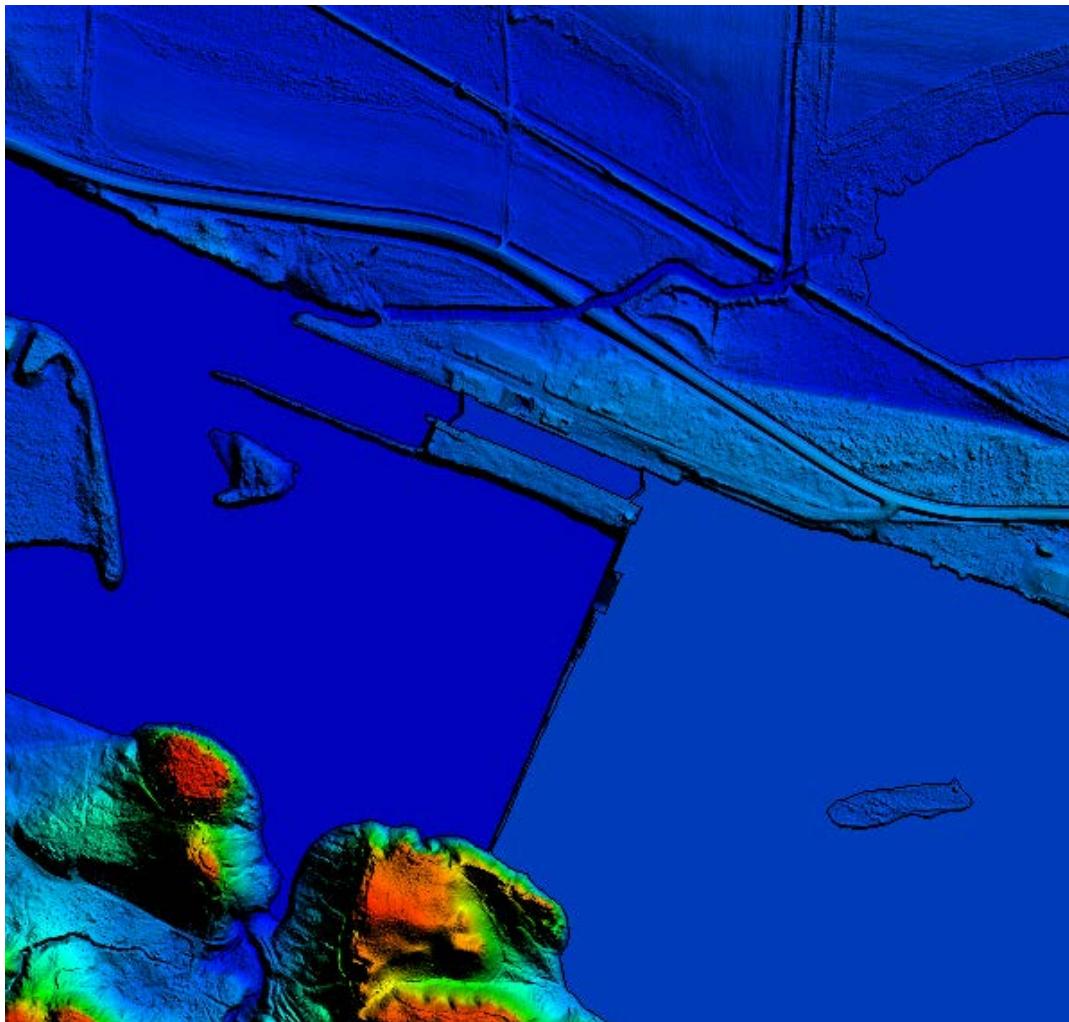

Figure 14: DEM shows Large Dam structure that disrupts natural monotonic river flow, coupled with a lock system.

### FORMATTING

After the final QA/QC is performed and all corrections have been applied to the dataset, all LiDAR files are updated to the final format requirements and the final formatting, header information, point data records, and variable length records are verified using ASI proprietary tools. ASI routinely reviews for: proper LAS versions, Coordinate Reference System, Global Encoder Bit, Time Stamp, System ID, Multiple Returns, Intensity, Classification, Overlap and Withheld Points, Scan angle, XYZ Coordinates.

## LiDAR Positional Accuracy

### BACKGROUND

ASI quantitatively tested the dataset by testing the vertical accuracy of the LiDAR. The vertical accuracy is tested by comparing the discreet measurement of the survey checkpoints to that of the interpolated value within the three closest LiDAR points that constitute the vertices of a three-dimensional triangular face of the TIN. Therefore, the end result is that only a small sample of the LiDAR data is actually tested. However there is an increased level of confidence with LiDAR data due to the relative accuracy. This relative accuracy in turn is based on how well one LiDAR point "fits" in comparison to the next contiguous LiDAR measurement, and is verified as part of the initial processing. If the relative accuracy of a dataset is within specifications and the dataset passes vertical accuracy requirements at the location of survey checkpoints, the vertical accuracy results can be applied to the whole dataset with high confidence due to the passing relative accuracy. The nature of lidar data makes it difficult to assess absolute horizontal accuracy as one would with imagery or compiled planimetric data. Guidance on how absolute horizontal accuracy can be estimated and reported based on the error budget of the instrumentation and operational parameters can be found in ASPRS (2014). The horizontal accuracy of each lidar project shall be reported using the form specified by the ASPRS (2014).

### SURVEY VERTICAL ACCURACY CHECKPOINTS

For the vertical accuracy assessment of Block 3 IL 8 County project, one hundred twenty seven check points were surveyed. All of those check points are located within bare earth/open terrain (127 NVA points). Please see provided survey report which details and validates how the survey was completed for this project. Checkpoints were evenly distributed throughout the project area so as to cover as many flight lines as possible using the "dispersed method" of placement. All checkpoints surveyed for vertical accuracy testing purposes are listed in the following table.

Point ID	NAD83 (2011) Albers Equal Area	NAD83 (2011) Albers Equal Area	NAVD88 (Geoid12B)

Table 13: Block 3 IL 8 County project LiDAR Validation Checkpoints.

12/30/2020

Page 58 of 251

**Figure 15: Location of Block 3 IL 8 County LiDAR NVA Checkpoints**

**Figure 16: No VVA Checkpoints were located in Block 3 IL 8 County**

## VERTICAL ACCURACY TEST PROCEDURES

NVA (Non-vegetated Vertical Accuracy) is determined with check points located only in nonvegetated terrain, including open terrain (grass, dirt, sand, and/or rocks) and urban areas, where there is a very high probability that the LiDAR sensor will have detected the bare-earth ground surface and where random errors are expected to follow a normal error distribution. The NVA determines how well the calibrated LiDAR sensor performed. With a normal error distribution, the vertical accuracy at the 95% confidence level is computed as the vertical root mean square error (RMSEz) of the checkpoints  $\times 1.9600$ . For the Block 3 IL 8 County project, vertical accuracy must be 19.6 cm (0.64 ft) or less based on an RMSEz of 10 cm (0.33 ft)  $\times 1.9600$ . VVA (Vegetated Vertical Accuracy) is determined with all checkpoints in vegetated land cover categories, including tall grass, weeds, crops, brush and low trees, and fully forested areas, where there is a possibility that the LiDAR sensor and post-processing may yield elevation errors that do not follow a normal error distribution. VVA at the 95% confidence level equals the 95th percentile error for all checkpoints in all vegetated land cover categories combined. The Block 3 IL 8 County Lidar project VVA standard is 29.4 cm (0.96 ft) based on the 95th percentile.

Quantitative Criteria	Measure of Acceptability
Non-Vegetated Vertical Accuracy (NVA) in open terrain and urban land cover categories using RMSEz *1.96	19.6 cm (based on RMSEz (10 cm)*1.96)
Vegetated Vertical Accuracy (VVA) in all vegetated land cover categories combined and at the 95 <sup>th</sup> Percentile error	29.4 cm (based on combined 95th percentile)

Table 14: Acceptance Criteria.

The primary QA/QC vertical accuracy testing steps used by ASI are summarized as follows:

1. SAM surveyed QA/QC vertical checkpoints in accordance with the project's specifications.
2. Next, ASI interpolated the bare-earth LiDAR DTM to provide the z-value for every checkpoint.
3. ASI then computed the associated z-value differences between the interpolated z-value from the LiDAR data and the ground truth survey checkpoints and computed NVA, VVA, and other statistics.
4. The data were analyzed by ASI to assess the accuracy of the data. The review process examined the various accuracy parameters as defined by the scope of work. The overall descriptive statistics of each dataset were computed to assess any trends or anomalies. This report provides tables, graphs and figures to summarize and illustrate data quality.

## VERTICAL ACCURACY RESULTS

The table below summarizes the tested vertical accuracy resulting from a comparison of the surveyed checkpoints to the elevation values present within the fully classified LiDAR LAS files.

Land Cover Category	# of Points	NVA – Non-vegetated Vertical Accuracy (95% confidence) Spec = 0.196 m	VVA – Vegetated Vertical Accuracy (95 <sup>th</sup> Percentile) spec = 0.294 m
NVA	127	0.108	
VVA	92		0.053

Table 15: Tested NVA and VVA.

## HORIZONTAL ACCURACY TEST PROCEDURES

The Riegl LMS-Q1560 data set was produced to meet ASPRS “Positional Accuracy Standards for Digital Geospatial Data” (2014) for a 23 (cm) RMSE<sub>x</sub> / RMSE<sub>y</sub> Horizontal Accuracy Class which equates to Positional Horizontal Accuracy = +/- 45.08 cm at a 95% confidence level.

The Leica ALS70 data set was produced to meet ASPRS “Positional Accuracy Standards for Digital Geospatial Data” (2014) for a 19.8 (cm) RMSE<sub>x</sub> / RMSE<sub>y</sub> Horizontal Accuracy Class which equates to Positional Horizontal Accuracy = +/- 38.88 cm at a 95% confidence level.

The Optech Galaxy Prime data set was produced to meet ASPRS “Positional Accuracy Standards for Digital Geospatial Data” (2014) for a 26.6 (cm) RMSE<sub>x</sub> / RMSE<sub>y</sub> Horizontal Accuracy Class which equates to Positional Horizontal Accuracy = +/- 52.21 cm at a 95% confidence level.

## Breakline Production Methodology

MicroStation, in conjunction with TerraSolid's TerraScan and TerraModeler was utilized for the collection of hydrologic breaklines, which occurred independently of manual edit. Collection was done using 2D information in the LAS format, intensity format, and ground surface. Breaklines are developed to the limit of the project boundary. Breaklines are in the same coordinate reference system and unit of measure as the LiDAR point delivery. Hydrologic water-surface edges are set at or just below the immediately surrounding terrain. Breaklines are developed to the limit of the project boundary.

### BREAKLINE QUALITATIVE ASSESSMENT

Completeness and horizontal placement is verified through visual review against LiDAR intensity imagery, and bare earth surface. Breakline features are checked for connectivity of features, enforced monotonicity on linear hydrographic breaklines, and flatness on water bodies.

After all corrections and edits to the breakline features, the breaklines are imported into the final GDB and verified for correct formatting.

### FEATURE DEFINITION

#### Inland Streams and Rivers

Streams and Rivers with a nominal width of 30 meters (100 feet), were collected to best fit the shoreline by using information in the LAS format; intensity format, ground surface TIN, and sometimes "quick guide" contours. Streams and rivers do not break at bridges, but they are closed ended breaks at culvert locations. Streams and Rivers breaklines have been delivered in PolylineZ format in the final GDB.

#### Inland Ponds and Lakes

Inland ponds and lakes of 2 acres (86,111 square feet/ ~350'/~106 meter diameter for a round pond) or greater were collected. Inland pond and Lakes were collected to best fit the shoreline by using information in the LAS format; intensity format, ground surface TIN, and sometimes "quick guide" contours. Inland pond and Lakes Breaklines have been delivered in PolygonZ format in the final GDB.

#### Islands

Permanent island 4046m<sup>2</sup> (1 acre) or larger were delineated within all water bodies. Breaklines have been delivered in PolygonZ format in the final GDB

#### Bridge Breaklines

Breaklines were placed across the bottom of the bridge embankment when triangulation occurred due to bridge deck classification. Breaklines have been delivered in PolylineZ format in the final GDB.

## Intensity Imagery Production & Qualitative Assessment

### INTENSITY PRODUCTION METHODOLOGY

ASI utilized MicroStation in conjunction with TerraSolid's TerraScan for Intensity production. Global Mapper was used to QC the products. ArcGIS was used to finalize the Intensity's projection.

Intensity Images are created for each tile in the tiling schema. The Intensities are reviewed for any issues requiring corrections. Tiles are verified for final formatting and loaded into Global Mapper to ensure there are no missing, or corrupt tiles, and to check for seamlessness across tile boundaries.

### INTENSITY QUALITATIVE ASSESSMENT

ASI performed a qualitative assessment of the Intensity deliverables to ensure that all tiled Intensity products were delivered with the proper extents, and contained proper referencing information. Intensity bounding values were manually set in RiProcess to utilize the full range of values available. Subcontractor intensities were linearly scaled to match the intensity of ASI's collection. During some reprocessing to improve the calibration, some points received maximum value intensity; however these were corrected to the original output values prior to delivery.

Figure 17: Intensity Image example.

## DEM Production & Qualitative Assessment

### DEM PRODUCTION METHODOLOGY

ASI utilized MicroStation Connect in conjunction with TerraSolid's TerraScan and TerraModeler for DEM production. Global Mapper version 21.0 was used to format and QC the products. GDAL version 2.4.0 was used to finalize the DEMs projection.

The final bare earth LiDAR points are used to create a terrain. The final 3D breaklines collected for the project are enforced in the terrain. The terrain is then converted to raster format using linear interpolation. DEMs are created for each tile in the tiling schema. The DEMs are reviewed for any issues requiring corrections, including remaining LiDAR ground misclassification, erroneous breakline elevations, poor hydro flattening, and processing artifacts. Tiles are verified for final formatting and loaded into Global Mapper to ensure there are no missing, or corrupt tiles, and to check for seamlessness across tile boundaries.

### DEM QUALITATIVE ASSESSMENT

ASI performed a qualitative assessment of the bare earth DEM deliverables to ensure that all tiled DEM products were delivered with the proper extents, were free of processing artifacts, and contained proper referencing information.

The image below shows an example of a bare earth DEM.

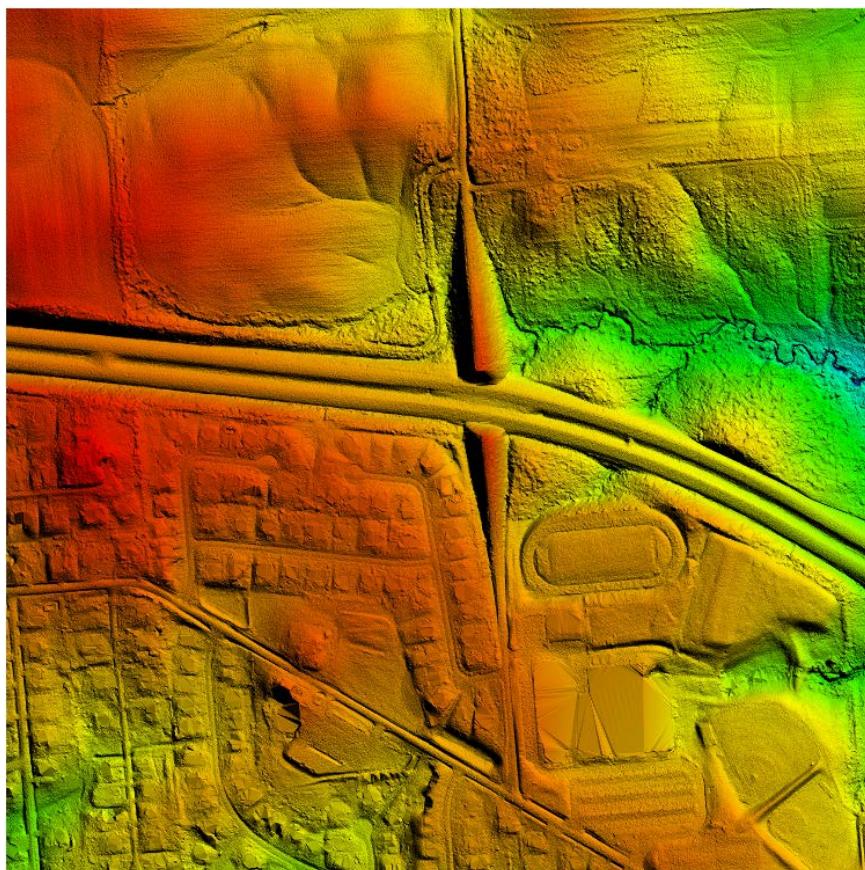

Figure 18: Block 3 IL 8 County project bare earth DEM

## DEM VERTICAL ACCURACY RESULTS

The same 127 checkpoints that were used to test the vertical accuracy of the LiDAR were used to validate the vertical accuracy of the final DEM products as well. Accuracy results may vary between the source LiDAR and final DEM deliverable. DEMs are created by averaging several LiDAR points within each pixel which may result in slightly different elevation values at each survey checkpoint when compared to the source LAS. The DEM pixel does not average several LiDAR point's together, it interpolates (linearly) between two or three points to derive an elevation value. The vertical accuracy of the DEM is tested by extracting the elevation of the pixel that contains the x/y coordinates of the checkpoint and comparing these DEM elevations to the survey elevations.

Table 16; summarizes the tested vertical accuracy result from a comparison of surveyed checkpoint to the elevation values present within the final DEM dataset.

Land Cover Category	# of Points	NVA – Non-vegetated Vertical Accuracy (RMSEz x 1.960)	VVA – Vegetated Vertical Accuracy (95 <sup>th</sup> percentile)
NVA	127	0.096	
VVA	92		0.060

Table 16: DEM vertical accuracy summary

DEM datasets were tested to meet ASPRS Positional Accuracy Standards for Digital Geospatial Data (2014) for a 10 cm RMSEz Vertical Accuracy Class. Actual NVA accuracy was found to be RMSEz = 0.049 meters with a 0.096 meters accuracy at 95 % confidence level. Actual VVA accuracy tested 0.060 meters using checkpoints located in forested land cover categories at the 95th percentile, derived according to ASPRS guidelines, tested against the DEM. Based on the vertical accuracy testing conducted by ASI, the DEM dataset for the Block 3 IL 8 County project satisfies the project's pre-defined vertical accuracy criteria.
